

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

LETTER OF TRANSMITTAL

Sir: I have the honor to transmit herewith the Eighteenth Biennial Report of the Office of the State Engineer, for the period from December 1st, 1914, to November 30th, 1916, inclusive.

Respectfully,

ADELBERT A. WEILAND,
State Engineer.

To His Excellency,
GEORGE A. CARLSON,
Governor of Colorado.

LIST OF OFFICIALS IN CHARGE OF WATER DISTRIBUTION

STATE ENGINEERS OF COLORADO

Since Organization of Department, June 3, 1881.

Eugene K. Stimson	June 1881 to April 1883
Edwin S. Nettleton.....	April 1883 to April 1887
J. Sire Greene.....	April 1887 to April 1889
James P. Maxwell.....	April 1889 to April 1893
Charles B. Cramer.....	April 1893 to April 1895
Horace A. Sumner.....	April 1895 to April 1897
John E. Field.....	April 1897 to April 1899
Addison J. McCune.....	April 1899 to April 1903
Louis G. Carpenter.....	April 1903 to April 1905
Thomas W. Jaycox.....	April 1905 to April 1909
Charles W. Comstock.....	April 1909 to April 1913
John E. Field.....	April 1913 to April 1915
Adelbert A. Weiland.....	April 1915 to April 1917

LIST OF OFFICERS AND EMPLOYEES

State Engineering Department.

Adelbert A. Weiland.....	State Engineer
Lyman E. Bishop.....	Deputy State Engineer
Thomas Grieve, Jr.....	Chief Hydrographer
J. H. Bailly.....	Hydrographer
M. N. Grant, Jr.....	Hydrographer
H. D. Amsley.....	Hydrographer
H. E. Turner.....	Hydrographer
R. G. Hosea.....	Hydrographer for The Colorado Water Users' Ass'n
Josephine Kelly.....	Office Clerk
C. C. Hezmalhalch.....	Draftsman
Ellie H. Rhodes.....	Filing Clerk
Arah Shaw	Stenographer

IRRIGATION DIVISION ENGINEERS

Div. No. 1	Fillmore Cogswell	Denver
Div. No. 2	Edward R. Chew.....	Pueblo

CHAPTER I

INTRODUCTION

The past two years have seen very little new irrigation development. During the years from 1908 to 1912 there was, in Colorado and the West, an unprecedented growth and development of irrigation projects. Many of them had merit, some were of precarious worth and others were purely financial inflations with no merit at all. The boom in mining stocks and in mining development during the early days, in the West, never reached such flagrant stages as did this inflation of irrigation securities and development. This speculation in lands and water rights was partly fostered and perpetuated by the irrigation district laws on the statute books of Colorado. While these laws are, in a sense, modeled after municipal laws and the organization is intended to work financially as a municipality, the fact is everywhere evident that the irrigation district laws have failed to accomplish the end sought. Such flagrant abuses were practiced under this law, so many districts were organized for no other purpose than to assess lands to pay the salaries of officers of the district, that the depreciation of irrigation securities was inevitable. Promoters, aided and fostered by certain classes,—boomers, real estate men and so-called colonizers,—loaded many acres of Colorado's lands to the hub with worthless irrigation securities. They sowed to the wind, and Colorado, for several years past, has been reaping the whirlwind. Our irrigation securities became a byword and a jest in the financial market. They were repudiated at home and abroad. So worthless were some of the projects that our own financial houses hung their heads in shame when asked about them by eastern capital. This fact is regrettable, for, after a few years of winnowing and sifting out the bad projects; after a most trying period of depreciation of the bonds; repudiation of debts; abandonment of projects, the sound irrigation development is beginning to revive. The good project has had to bear the sins and burdens of the bad. This is not fair. Colorado has many excellent propositions that only need financial aid to make them complete successes. The citizens of Colorado should all see to it that our irrigation securities be, in the future, kept free from criticism and that the moneyed interests of the United States are made to appreciate the value of our irrigation securities. The time is now ripe for the placing of our irrigation securities on a par with any other gilt-edge investment and what it needs is the proper presentation of our case to people who are interested in investments.

What has been said relative to our difficulty in financing bona fide irrigation propositions, can be said with equal force about the financing of our drainage districts. It has been exceedingly difficult to secure money for the reclamation of our lands that have

been rendered untillable on account of seepage and alkali. It is now becoming less difficult to finance our drainage districts, and, as a result, some quite satisfactory work is being done in the reclamation of our seepage lands. Much more yet remains to be done, and the investor should be made to appreciate that one of the best investments obtainable is in drainage securities whether private or district.

While no great development has been carried on in the past two years, yet it is gratifying to see great progress in our irrigation development. It is one thing to get the physical structures built and to place the water available to the farmer; it is another thing to secure the proper settler who will develop the land into a paying farm. Within the last two years, the farmers under our new irrigation projects and, in fact, under all of our irrigation projects, have been getting a better hold on the physical conditions to be met and are learning more scientific farming. They are also learning the value of water and the proper methods of applying the same to crops as relates to time and quantity.

Many of our farms, under the irrigation propositions in the state, are too large. What we need is farms cut up into smaller units with a substantial farmer on each smaller unit. It is the accomplishing of the development of our irrigated area that takes the time and, after all, leads to the greatest results. It has been variously estimated that a farmer and his family is worth at least \$5,000 per year to the commonwealth in which he lives. The present irrigable area in the State of Colorado is not far from 3,000,000 acres of land. The average holding of our present farmer is in the neighborhood of 100 acres. Assuming that there are practically 30,000 farmers in the State of Colorado, their average worth to the state is approximately \$150,000,000. The size of each farm can be reduced to at least 50 acres, for with 50 acres of irrigated land, any farmer can make a good living for his family. Every effort should be made to reduce the acreage of each farm and increase the number of farmers. In other words, we should have on our irrigated lands in the state at least 60,000 heads of families. This would add to the wealth of the state each year an additional \$150,000,000. The State of Colorado can afford to spend a large amount of money each year to get in contact with the class of people that should be located on our irrigated farms, and it would be a far-sighted and winning policy for the State of Colorado to make some large provision for the intensive settlement and cultivation of our irrigated lands.

Chapter 124 of the Session Laws of 1915 provides that "No * * * biennial report of any officer shall hereafter be printed at the expense of the state until the Governor has designated * * * how much * * * and how many copies thereof shall be printed." In preparing this biennial report the State Engineer submitted 742 pages of manuscript to the Governor for his approval. Shortly thereafter the State Auditing Board, having available only a lim-

ited amount of funds for printing biennial reports, ordered all work on biennial reports temporarily stopped pending the receipt of an opinion requested from the Attorney General interpreting Chapter 124, quoted above. The Attorney General held that Chapter 124 amended, but did not repeal, the existing statutes governing biennial reports, and that Section 4710 R. S. 1908 was still in full force and effect. This section provides, "that no report shall exceed three hundred printed pages." Accordingly, the biennial report was returned to the State Engineer, with instructions to cut the same to 300 printed pages. To comply with these instructions the original manuscript, as finally returned to the printer, consisted of 360 pages. On account of the cutting in the size of the report it has been necessary to omit the following chapters, which were originally submitted for publication:

Recommended Legislation.

Hydrographic Department.

Regulations for Filing Claims to Water Rights, and Plans and Specifications for Construction of Dams.

Data on Irrigation and Drainage Districts in Colorado.

Compromise Contract between United States Irrigating Company and Graham Ditch Company. Kansas-Colorado Interstate Litigation.

Reservoir Supervision—Construction and Failures.

Standley Lake Dam.

Administration of Water in Water District No. 23.

Losses of Sanchez Reservoir Water in Culebra River.

Drainage in Colorado.

Pumping Water for Irrigation.

All Discharge Measurements in connection with the Hydrographic Data.

These chapters are on file in the State Engineer's office, and can be consulted by those interested.

It is sincerely regretted that it was impossible to publish this biennial report in its entirety, and it is hoped that our Legislature will enact statutes and provide adequate means so that the next biennial report of the State Engineer can be published in its entirety, and be a report which will reflect credit to the State of Colorado. During the biennial period just passed some 15,000,000-acre feet of water was distributed by the State Engineer to the water users of the state, and the market value of this water is at least \$40,000,000. Considering this item alone, the State Engineer's biennial report should not be limited to any specified number of pages.

CHAPTER II

FINANCIAL

The Twentieth General Assembly made appropriations for the State Engineer's office as follows:

State Engineer, salary.....	\$ 6,000.00
Two Deputies, State Engineer, salaries.....	5,400.00
Traveling and contingent expenses of Engineer and Deputies.....	2,800.00
Draftsman, salary.....	3,000.00
Chief Hydrographer, salary.....	3,600.00
Four Hydrographers, salaries, at \$125.00 per month.....	12,000.00
Hydrographers' expenses.....	4,000.00
Chief Hydrographer's expenses.....	1,200.00
Stenographic services.....	2,600.00
File Clerk, salary.....	2,400.00
Clerk, salary, December, 1914.....	100.00
Incidental expenses.....	3,000.00
Irrigation Division Engineers—	
Division No. 1, salary.....	5,000.00
Division No. 2, salary.....	5,000.00
Division No. 3, salary.....	3,000.00
Division No. 4, salary.....	3,000.00
Division No. 5, salary.....	3,000.00
Division Engineers' expenses.....	5,000.00
One automobile.....	750.00
Total	\$70,850.00

From these funds balances were turned back to the General Fund as follows:

Deputies, salaries.....	\$ 852.00
Traveling and contingent expenses, Engineer and Deputies.....	47.64
Hydrographers, salaries.....	545.71
Chief Hydrographer, expenses.....	29.73
Hydrographers, expenses.....	796.82
Stenographic services.....	148.36
Incidental expenses.....	17.91
Division Engineers, expenses.....	151.30
Total	\$2,589.47

This leaves the amount expended by the State Engineer's office for the biennial period, \$68,260.53.

As a credit against this there has been transmitted to the State Treasurer for fees received in this office during 1915-1916, the sum of \$13,814.03, making the net cost of operating this office, \$54,446.50.

In addition to the sums expended from funds appropriated for this office, the sum of \$8,275.68 has been spent from the Water Defense Fund for the salaries and expenses of two hydrographers. Of this amount \$3,275.68 was for traveling expenses.

As against this there was turned into the General Fund \$796.82 from the hydrographers' expense fund.

From this it will be seen that the amount appropriated for hydrographers' expenses is inadequate, and should be increased from \$4,000.00 to at least \$6,000.00 for the biennial period.

Following is a detailed statement of the expenditures and receipts of the various funds handled by this office:

STATE ENGINEER—SALARY.

Appropriated		\$6,000.00
Jno. E. Field	\$1,150.00	
A. A. Weiland	4,850.00	
Total	\$6,000.00	\$6,000.00

DEPUTY STATE ENGINEER—SALARY.

Appropriated		\$5,400.00
A. F. Hewitt	\$ 834.00	
R. I. Meeker	600.00	
Lyman E. Bishop	3,114.00	
Balance in fund	852.00	
Total	\$5,400.00	\$5,400.00

TRAVELING AND CONTINGENT EXPENSES, STATE ENGINEER AND DEPUTIES.

Appropriated		\$2,800.00
R. I. Meeker	\$ 108.38	
Jno. E. Field	103.90	
A. A. Weiland	1,620.65	
Lyman E. Bishop	387.28	
Central Garage	374.40	
Pueblo Chieftain	25.20	
Rocky Mountain News	25.20	
Denver Times	25.20	
Pueblo Star Journal	25.20	
Montrose Press	21.70	
South Park Merc. Co.	5.25	
Geo. M. Robinson Instr. Works	30.00	
Balance in fund	47.64	
Total	\$2,800.00	\$2,800.00

DRAUGHTSMAN—SALARY.

Appropriated		\$3,000.00
O. L. Nelson	\$2,187.50	
H. R. Harrison	687.50	
C. C. Hezmalhalch	125.00	
Total	\$3,000.00	\$3,000.00

CHIEF HYDROGRAPHER—SALARY.

Appropriated		\$3,600.00
Thos. Grieve, Jr.	\$3,600.00	
Total	\$3,600.00	\$3,600.00

HYDROGRAPHERS—SALARY.

Appropriated		\$12,000.00
D. L. Bundy	\$ 500.00	
G. P. Woodhall	500.00	
C. C. Hezmalhalch	1,750.00	
H. D. Phelps	302.42	
Lucretia Prentiss (Industrial Commission)	700.00	
M. N. Grant, Jr.	875.00	
Margaret Wilkinson (Secretary of State)	67.74	
L. S. Fimple	225.80	
Josephine Kelly (clerical service)	1,300.00	
M. E. Bungler	645.83	
H. R. Harrison	1,525.00	
J. H. Bailly	812.50	
C. L. Chatfield	1,625.00	
H. D. Amsley	625.00	
Balance in fund	545.71	
Total	\$12,000.00	\$12,000.00

STENOGRAPHIC SERVICES.

Appropriated		\$2,600.00
Anna O. Finch.....	\$ 503.33	
Ruth Moore	51.64	
Arah Shaw	1,846.67	
Elsie B. Mellor.....	50.00	
Balance in fund	148.36	
Total	\$2,600.00	\$2,600.00

CLERK—SALARY.

Appropriated		\$ 100.00
May A. Bradford.....	\$ 100.00	
Total	\$ 100.00	\$ 100.00

FILE CLERK—SALARY.

Appropriated		\$2,400.00
Ellie H. Rhodes.....	\$2,400.00	
Total	\$2,400.00	\$2,400.00

INCIDENTAL EXPENSES.

Appropriated		\$3,000.00
Gage readers' salaries.....	\$2,547.80	
Norman Mills, for feeding state team.....	45.00	
Chas. H. Yust, repairing gaging station.....	23.10	
W. R. King, repairing gaging station.....	6.25	
Kremmling Lumber & Supply Co., lumber for new gage.....	20.64	
Julien P. Friez & Sons, tape for automatic gage.....	6.25	
Wm. Ainsworth & Son, repairing transit.....	12.00	
W. H. Kistler Stationery Co.	21.00	
Cardwell Blue Print & Supply Co., 18" level.....	135.85	
Cardwell Blue Print & Supply Co., repairs for current meter.....	25.20	
Cardwell Blue Print & Supply Co., level rod and tripod.....	24.50	
Lallie Surveying Instr. Co., water level gage.....	40.00	
Cardwell Blue Print & Supply Co., architect's level and level rod	74.50	
Balance in fund	17.91	
Total	\$3,000.00	\$3,000.00

TRAVELING EXPENSES FOR HYDROGRAPHERS.

Appropriated		\$4,000.00
H. D. Amsley.....	\$ 267.51	
G. P. Woodhall.....	12.05	
C. L. Chatfield.....	314.30	
Norman Mills, feed state team, etc.....	100.90	
M. N. Grant, Jr.	528.38	
D. L. Bundy.....	169.60	
C. C. Hezmalhalch.....	346.47	
Central Garage	113.41	
Geo. Tritch Hardware Co.	35.75	
M. E. Bunger.....	154.16	
H. R. Harrison.....	457.66	
J. H. Bailly.....	471.29	
Ford Motor Co.	231.70	
Balance in fund.....	796.82	
Total	\$4,000.00	\$4,000.00

TRAVELING EXPENSES CHIEF HYDROGRAPHER.

Appropriated		\$1,200.00
Thos. Grieve, Jr.	\$1,170.27	
Balance in fund.....	29.73	
Total	\$1,200.00	\$1,200.00

ONE AUTOMOBILE.

Appropriated		\$ 750.00
Hussie Automobile Co.	\$ 750.00	
Total	\$ 750.00	\$ 750.00

IRRIGATION DIVISION ENGINEER, DIV. NO. 1—SALARY.

Appropriated		\$5,000.00	\$5,000.00
F. Cogswell			

IRRIGATION DIVISION ENGINEER, DIV. NO. 2—SALARY.

Appropriated		\$5,000.00
E. R. Chew	\$ 752.68	
C. W. Beach	288.97	

The legal appointee to this office is in litigation and a complete statement cannot be furnished at this time.

IRRIGATION DIVISION ENGINEER, DIV. NO. 3—SALARY.

Appropriated		\$3,000.00
F. W. Swanson	\$1,000.00	
D. A. Norton	2,000.00	
Total	\$3,000.00	\$3,000.00

IRRIGATION DIVISION ENGINEER, DIV. NO. 4—SALARY.

Appropriated		\$3,000.00
H. C. Getty	\$3,000.00	

IRRIGATION DIVISION ENGINEER, DIV. NO. 5—SALARY.

Appropriated		\$3,000.00
Theodore Rosenberg	\$1,951.62	
A. J. Dickson	1,048.38	
Total	\$3,000.00	\$3,000.00

IRRIGATION DIVISION ENGINEER, DIV. NO. 1—TRAVELING EXPENSES

Appropriated		\$1,000.00
F. Cogswell	\$ 961.64	
Balance	38.36	
Total	\$1,000.00	\$1,000.00

IRRIGATION DIVISION ENGINEER, DIV. NO. 2—TRAVELING EXPENSES

Appropriated		\$1,000.00
E. R. Chew	\$ 815.91	
C. W. Beach	90.12	

The legal appointee to this office is in litigation and a complete statement cannot be furnished at this time.

IRRIGATION DIVISION ENGINEER, DIV. NO. 3—TRAVELING EXPENSES

Appropriated		\$1,000.00
F. W. Swanson	\$ 129.21	
D. A. Norton	870.07	
Balance72	
Total	\$1,000.00	\$1,000.00

IRRIGATION DIVISION ENGINEER, DIV. NO. 4—TRAVELING EXPENSES

Appropriated		\$1,000.00
H. C. Getty	\$1,000.00	

IRRIGATION DIVISION ENGINEER, DIV. NO. 5—TRAVELING EXPENSES

Appropriated		\$1,000.00
Theodore Rosenberg	\$ 498.57	
A. J. Dickson	389.21	
Balance in fund	112.22	
Total	\$1,000.00	\$1,000.00

DISTRIBUTION OF FEES RECEIVED IN THE STATE ENGINEER'S OFFICE DECEMBER 1, 1914, TO NOVEMBER 30, 1916, INCLUSIVE.

Filing claims to water rights	\$11,083.00
Postage	21.19
Blue prints	1,356.54
Certifications	425.00
Sale of "Irrigation Law"	40.00
Rating ditches	172.60
Examination of plans for dams	436.00
Examination of reservoir dams	138.70
Office labor	56.00
Filing of transfer decrees	80.00
Sale of old typewriter	5.00
Remitted to State Treasurer	\$13,814.03

Remitted to State Treasurer	\$13,814.03	\$13,814.03

CHAPTER III

WATER RIGHT DECREES

During the past biennial period all of the water right decrees issued by the District Courts of this state and on file in this office, have been indexed by the present State Engineer.

The statutes of this state require that certified copies of all water right decrees entered by the District Courts be forwarded to the office of the State Engineer by the clerk of the District Court issuing such decrees. There is on file in the office of the State Engineer at this time some fourteen thousand decrees which have been entered by our District Courts. While the statute requires that as soon as a decree has been issued, a certified copy be filed in the office of the State Engineer, yet it is known that in numerous instances decrees have been entered and no copy of this decree is on file in this office.

Each separate decree on record in the office of the State Engineer has been indexed in two different ways. For one of these systems a card index has been made for each of the seventy water districts of the state. A separate card giving the pertinent and salient points of each decree has been made, and these cards are filed alphabetically in the proper water district. In compiling this card index, white cards 4 by 6 inches were prepared, having definite headings, and these cards were filled in on the typewriter, one card for each decree. The white cards are of two different kinds, one for ditch decrees and the other for reservoir decrees.

Plate I shows one of the ditch decree cards, and Plate II the reservoir decree cards.

These white cards represent a transaction by the District Courts of this state, whereby water is decreed or taken from one of the natural streams of this state, and credited to a specific ditch.

The statutes of this state authorize the transfer of water from the ditch to which it was originally decreed, to another ditch. To provide for this contingency, and to properly index all of the transfer decrees which are a matter of record in this office, cards similar to the ditch and reservoir cards shown in Plates I and II, were provided. Plate III shows one of the transfer cards in its original color, blue, which represents a transfer of water FROM the particular ditch in question. Similarly, Plate IV shows a transfer card in its original color, pink, which card is used in crediting a transfer of water TO the particular ditch in question.

By means of the white cards crediting a ditch with water from a stream, in question, the blue debit cards transferring water from the ditch, and a pink card crediting or transferring water to the ditch, it is now possible, after all of the indexing has been completed and all of these cards filed alphabetically in their proper district, to, by means of these cards, determine the present status of the water rights of any particular ditch.

Plate V is a reproduction of the method adopted for the second system of indexing. Under this system the ditches in each district are arranged chronologically in the relative orders of their priorities. The original sheet from which Plate V was made is 14 to 16 inches, and these sheets are bound in a loose leaf ledger. The two systems of indexing adopted permit additions to them as new decrees are filed in the office.

The work of indexing these decrees was inaugurated in June, 1915, and completed during the fall of 1916. During this period a total of thirteen thousand nine hundred and fifteen (13,915) decrees were indexed. The distribution of these decrees is shown in Table I.

TABLE I

DECREES INDEXED AND ON RECORD IN THE OFFICE OF STATE ENGINEER.

Until this index of the water right decrees was compiled, the office of State Engineer was badly crippled by not having this information in usable form. It is now possible to answer personal inquiries and correspondence relative to the particular status of any ditch with considerable satisfaction. The only weakness existing is due to the incompleteness of the files of the decrees on record in the office of the State Engineer. Every attempt has been made to obtain from the clerks of the District Courts copies of all decrees not on file in this office. In some instances, requests for copies of these decrees have brought the desired results, but in the majority of instances it has not been possible to obtain copies of the decrees which are lacking.

It is believed that the chronological indexing of water right decrees should be published by districts, and that these published decrees should be available for sale by districts at a nominal sum to the public. Our Legislature will be requested to loan this office two thousand five hundred dollars (\$2,500.00) for the purpose of publishing these decrees, this loan to be repaid by receipts from the sale of the published decrees. It is believed this loan could be repaid in three or four years at the most, for water users, attorneys and engineers interested in the use and administration of the waters of this state would undoubtedly be anxious to secure copies of the districts in which they were interested.

CHAPTER IV

CLAIMS FOR APPROPRIATIONS OF WATER

During the biennial period there have been filed in this office 826 maps claiming water for 724 ditches and 173 reservoirs. The total claimed for ditches is 6,120.28 cubic feet per second. The total amount claimed for reservoirs is 72,280-acre feet.

The estimated cost of ditches for which claims have been filed during 1915 and 1916 is \$1,865,599, and the estimated cost of reservoirs is \$1,576,126. These estimates are as stated on maps filed. In most cases the estimates thus given are too low.

The following tables show for each district for each irrigation division and for the entire state, the number of claims filed for ditches and reservoirs, the amount of water claimed for them and the estimated cost of construction :

DIVISION NO. I

District Number	No. of Ditches	Total amount claimed for Ditches, Cubic feet per second	No. of Reservoirs	Total amount claimed for Reservoirs, Cubic feet	Estimated cost of Construction of Ditches	Estimated cost of Construction of Reservoirs

CHAPTER V

ANNUAL REPORTS OF DIVISION ENGINEERS

ANNUAL REPORT DIVISION ENGINEER DIVISION NO. 1, FOR 1915

November 30, 1915.

Mr. A. A. Weiland,
State Engineer,
Denver, Colorado.

Dear Sir: As provided for in Section 12, Chapter 125, page 287, Session Laws of 1903, I herewith submit a report of the work of this division during the past irrigation season. All the other provisions of the above section are more honored in the breach than in the observance. I would recommend that it be amended to read as follows:

"Section 12. Each irrigation division engineer shall file with the state engineer. on or before December 15th of each year, an annual report, which shall include a tabulated statement of the reports of the water commissioners, as hereinafter defined, and any other information which will tend to improve the distribution and use of water within his division.

"All acts or parts of acts in conflict herewith are hereby repealed."

The annual appeals of District No. 3 from orders of this office relative to the distribution of water, have not been conspicuous by their absence. Inasmuch as appeals have been taken from the same rulings and orders to former state engineers without success, it would appear as though they were simply trying to wipe the slate clean and start anew with fresh appeals.

They have even gone back to the much litigated question of the right to use the appropriation of the Mason and Hottel Mill Race, nights, Sundays and holidays.

If their position in these repeated appeals is well taken, a decision of the District Court would protect their rights for all time, and relieve this office of several very annoying questions in the administration of the irrigation laws of this state.

The right to run water in irrigation ditches for domestic use alone; the right to commence a second filling of reservoirs during any calendar year, when the water is needed for direct irrigation or for the first filling of reservoirs with appropriations of later date; the right to the full amount of a reservoir appropriation in addition to the amount of water in the reservoir on January 1st of each year, and the exclusive right to the use of the seepage water or leakage from ditches and reservoirs, are all questions that should be taken into the courts for a judicial determination of the intent of the law.

The Supreme Court of this state in January, 1915, handed down a decision in Case No. 7562, *The Greeley & Loveland Irrigation Company et al. vs. The Farmers' Pawnee Ditch Company*.

The majority opinion held that the right of a ditch to divert water for direct irrigation, is limited to a diversion for that purpose, and it is without right to divert and store such waters when by so doing other ditches would be deprived of water to which they were entitled for direct irrigation. The right to store water must be measured by the right to divert water for storage, and not by the physical condition of a ditch with a decreed appropriation for direct irrigation. It must, therefore, logically follow that whenever water is illegally stored in a reservoir, and the outlet conduit from said reservoir is such that the water can be returned to the stream, the division engineer not only has the authority, but it is his duty, to immediately order such illegally stored water discharged from the reservoir and run down the stream to the head-gates of the ditches legally entitled to the same.

The dissenting opinion, comparing this case with the so-called "Seven Lakes Case," says:

"The cases are as much alike as two peas, and yet the majority opinion of the court, written by the same judge, never even mentions it."

No doubt the irrigation attorneys, "learned in the law," will also be divided as to whether this decision of the Supreme Court affirms or, indirectly, reverses the decision in the "Seven Lakes Case."

Whatever the ultimate effect of this decision may be upon the "Seven Lakes Case," we are of the opinion that this office has no authority to distribute any water under the latter, without an order from the court.

During the past seven years the ruling of this office has been that temporary storage of water in reservoirs to be used later in the same season for agricultural purposes, will not be permitted when there is objection on the part of other appropriators, until a decision has been rendered by the District Court on the merits of each particular case.

For the information of the water commissioners of this state, past, present and prospective, I would submit the following excerpt from a decision of our Supreme Court, handed down in July, 1915, in Case No. 7867 and Case No. 7874:

Charles W. Comstock, as State Engineer et al. vs. The Fort Morgan Reservoir & Irrigation Company.

"By virtue of these provisions we have ruled that the several decrees entered in the water districts embraced in an irrigation division, are to be treated as one, and the water distributed accordingly, and that it is the duty of the engineer of an irrigation division to make such distribution by direction to the water commissioners under his control. In other words,

the purpose of the statutory provisions, to which we have referred, is to have the waters of a stream included in two or more water districts, so distributed that the appropriations in the different districts will receive the water to which they are severally entitled in the order of their priority, as established by the decrees in such districts. To attain this end, the division engineer is vested with control over the commissioners in his division. It is his duty to make inter-district distribution of water in his division. This is accomplished by directions to the commissioners under his control, and it follows that when he directs a commissioner in his division to cease supplying water to priorities postdating a specified date, it is the duty of the commissioner receiving such order to obey it, otherwise the purpose of the statute would be defeated, and the waters of a stream included in several districts could not be distributed in accordance with the relative rights of the owners of priorities as established by the decrees in such districts. If, after a commissioner receives an order from the division engineer, there is a rise in the streams in his district, it is his duty to forthwith report that fact to the latter official, but until the order he has received is modified or changed, he is without authority to disregard it, merely because in his opinion it is not necessary. When, therefore, a commissioner refuses or neglects to obey the orders of his superior, in circumstances which indicate an intention to continue that course, he may be compelled in an action by those injured, to distribute the water in his district as directed by the division engineer of the irrigation division which includes his district."

In the above cases the water commissioner of District No. 3 had stated:

"That he always asserted the right to act with reference to the condition of the stream in connection with the orders of the division engineer, according to his best judgment; that he believed he had this right, but might be mistaken."

There has been no serious trouble over the distribution of water during the past season. After seven years' experience in this office, "appeals" from my rulings are not looked upon as "trouble." The ditches diverting water directly from the South Platte River have been well supplied. There was, however, a shortage on the tributaries, which was in part supplied by seasonable rains, the rainfall being about four inches above normal. The Highland Canal, in District No. 8, of date January 18, 1879, only used reservoir water ten days in July and ten days in September, at the rate of 250 second feet, all drawn directly from Lake Cheesman. This loan of water was partially repaid by a run of water in September and October from Antero Reservoir of 7,911-acre feet. A deduction of 12½% of this amount was made for loss in transit.

On April 1, 1915, there was a break in the dam on the east side of the outlet of Sand Creek Reservoir in District No. 2, with a loss of about 1,500-acre feet of water.

The first use of water for irrigation was reported for the week ending Saturday, May 1st, except in District No. 8, where irrigation commenced about April 17th. There was a reported use of only 5,000-acre feet for irrigation in this division during April. The first use of reservoir water distributed via the river was reported by District No. 3, for week ending May 29th.

On September 28, 1915, the water commissioners in Districts Nos. 1 to 9, both inclusive, were notified that all ditches on the South Platte River proper were supplied. This notice left each water commissioner at liberty to distribute the waters to the ditches and reservoirs of his own district, without reference to the ditches and reservoirs in any other district.

On October 1st, permission was given to store in Lake Cheesman at the rate of 100 second feet, and on October 5th it was given unlimited storage. On October 21st, as soon as Lake Cheesman was reported full, storage was commenced in Antero Reservoir. These orders are still in force, and no doubt will not be modified before next April.

The wet and cold spring months caused crops to be rather late and reduced the first cutting of alfalfa one-half in some localities. Hail and grasshoppers also did a good deal of damage. Taking the division as a whole, it is doubtful if the farmers have ever had any better crops than during the season of 1915.

Fine crops have grown, not only on the irrigated lands, but also on the non-irrigated.

I hereto attach the regular statutory tabulation of the Water Commissioners' annual reports.

Respectfully submitted,

(Signed) F. COGSWELL,
Irrigation Division Engineer, Irrigation Division No. 1.

THE WEEKLY REPORTS OF THE WATER COMMISSIONER OF DISTRICT NO. 3 SHOW THE FOLLOWING AMOUNTS OF WATER BROUGHT OVER FROM DISTRICTS NOS. 47, 48 AND 51, INTO DISTRICT NO. 3, DURING 1915.

	From Dist. No. 47 In Acre Feet	From Dist. No. 48 In Acre Feet	From Dist. No. 51 In Acre Feet	Total
April	0	0	0	0
May	28	2,116	2,008	4,152
June	880	8,066	5,092	14,038

65	No Water Co	mmissioner ap	ointed.		
Totals....	9,149	2,014,659	1,502,094	305,164	125,484

NOTE.—The quantities given in columns (13) to (25) represent the total acreage that can be irrigated or was irrigated, whether the ditches only used the natural flow of streams, or used river and reservoir water combined. The approximate amount of water used in any district, except in District No. 3, will be found by adding together the "No. of Acre Feet Diverted by Ditches During Season from Natural Streams," given in column (12), and the "Amount of Water Carried from Reservoirs in Acre Feet," as given in column (10).

In District No. 3, 32,934 acre feet additional were diverted from Districts Nos. 47, 48 and 51, and used for direct irrigation.

In District No. 7, no water was diverted from District No. 51 and used by the Golden City and Ralston Creek Ditch.

ANNUAL REPORT

DIVISION ENGINEER, DIVISION NO. 1

November 30, 1916.

Mr. A. A. Weiland,
State Engineer,
Denver, Colorado.

Dear Sir: I herewith submit my report of the work of Irrigation Division No. 1, during the fiscal year ending November 30th, 1916.

The efficiency of this office would be increased 50 per cent if it was located at Greeley. The Division Engineer would then be in close touch with the conditions in the upper end of District No. 1, and the lower ends of Districts Nos. 2, 3 and 4, the very storm center of nine-tenths of all the trouble over the distribution of water in this division.

In order to receive the full benefit of the removal of the office to Greeley, the present inadequate expense fund should be increased to one thousand dollars (\$1,000.00) per annum.

During the past year the "Dove of Peace" has been hovering over this division and "Watchful Waiting" has taken the place of appeals to the courts from rulings of this office. This office, therefore, has been charged with no more serious crimes than contempt of court and conspiracy to defraud a ditch of its decreed appropriations. It is not easy to decide which charge is the most contemptible.

In June, inquiry was made relative to storing water in reservoirs when ditches break and they cannot divert their decreed ditch appropriations. An order was issued that when for any reason a ditch cannot divert its decreed appropriation, that water goes to the general supply of the stream and cannot be stored except by order of the court. It was also ruled that water must not be stored under the so-called "Seven Lakes Case," except when ordered by the court.

In passing, it might be noted, that up in Districts Nos. 3 and 4 this celebrated case appears to be very much alive, and several ditches are now, by order of the District Court, allowed to store their ditch appropriations when not needed for direct irrigation.

The laws of the state require water to be distributed in accordance with measurements made by the State Engineer or the Division Engineer. It was found necessary during the past season to issue orders to the water commissioners not to use rating tables furnished by outside parties. All rating tables used must be approved by this office.

No new questions relative to the distribution of water, except a special case in District No. 4, have been presented to this office during the season just past.

In the case of the Greeley & Loveland Irrigation Company vs. Huppe et al., reported in 60 Colorado, page 541, our Supreme Court

ruled that 23 small reservoirs in District No. 4 were not entitled to reservoir decrees.

These reservoirs "are small, natural depressions, or basins, lying along or near laterals from their ditches, through which they are filled, and in some instances the laterals pass through the reservoirs."

No water commissioner had ever distributed water to be stored in these reservoirs, nor had he ever been requested to do so. The reservoirs had never appropriated water from the river for storage purposes. The water stored in the past had been the excess water carried by the ditches for direct irrigation and not needed for immediate use. In 44 Colorado, page 233, reservoirs of a similar character are spoken of as "stock-filling reservoirs" and are not entitled to a priority. At the request of the Water Commissioner of District No. 4, this office on October 24th ruled that the present status of the above 23 reservoirs, is *not* that of undecreed storage reservoirs, but that of the so-called "stock-filling reservoirs" without any direct appropriations from the river for storage purposes, except in such cases where it has been ordered by the District Court.

The first order of the season to close junior ditches was issued on April 14th, directed to Districts Nos. 1 to 9 and 23, to cease all distribution of water to ditches and reservoirs of later date than January 1st, 1890, to supply a shortage of 350 second feet for direct irrigation under prior appropriations in District No. 1.

The false statement was made that the water was not to be used for direct irrigation, but was to be stored in the reservoirs and that the order was not warranted by conditions on the South Platte River. It was stated that on April 19th, 200 second feet was in the river above Sterling, in Logan County, in District No. 64. This water looked like the same kind of water that flows in the Cache la Poudre, therefore it must have come from that stream.

As a matter of fact, the above order was issued to supply ditches in District No. 1. The Bijou Canal, near Hardin in Weld County, the third county west of Logan County and 80 miles above Sterling, was demanding 250 second feet of 1888 water for direct irrigation. From April 13th to May 22nd, the Bijou was demanding 250 to 300 second feet. There was no storage in District No. 1 from April 4th to May 23rd, and then only for four days. The next storage was in October. The Water Commissioner of District No. 3 reports water used for irrigation under the Larimer and Weld Canal from and after April 2nd. We are of the opinion that irrigation is just as necessary under the Bijou Canal in April as under Larimer and Weld Canal.

From April 14th until October 9th, the supply of water for direct irrigation was inadequate to meet the demands of the decreed ditches. During June, July, August and September, the South Platte River was reported dry below Platteville, except during a few days in August.

Lake Cheesman discharged from storage during June and July, 14,881-acre feet to the credit of the Highline Canal in Dis-

trict No. 8. This water was repaid Lake Cheesman from Antero Reservoir during September and October.

On October 9th, at 7:00 P. M., the Water Commissioner of District No. 1 'phoned that the demands of his ditches for direct irrigation were supplied, including the 1907 appropriation of the Riverside Canal.

On October 10th, an order was sent to Districts Nos. 1, 2, 3, 4, 5 and 6 to store water in decreed reservoirs that have not been full once this calendar year, with appropriations of earlier date than January 1st, 1908. Also not to distribute water to any reservoir that has been full once this calendar year, nor to any undecreed ditch or reservoir, without my permission.

District No. 3 lived up to its reputation and the charge of "Discrimination" was duly recorded.

We trust that our next Legislature will establish by statute the "year," in the phrase, "to fill said reservoir once each year," as used in decrees and by the Supreme Court.

Storage was not allowed in the other districts as there was a shortage in Districts Nos. 2 and 8 for direct irrigation under earlier appropriations.

On October 17th, at 7:00 P. M., the Water Commissioner of District No. 1, 'phoned that, owing to the late heavy rains, his demands for direct irrigation were supplied and he had excess water for storage. He was instructed to store it in the reservoirs that have not been full once this calendar year. He reported that none of his reservoirs diverting water from the South Platte River had been full this year.

On October 18th, a general order was sent to Districts Nos. 1 to 9, as follows: "You are advised, that after you have supplied the demands of your reservoirs that have *not* been full once this calendar year, you are at liberty to distribute any excess water in your district to the reservoirs that have been full once this year, in accordance with the dates of their decreed appropriations."

Permission was given Lake Cheesman to store water on October 19th.

Up to the present time, Antero Reservoir has not been allowed to store any water as Lake Cheesman, from October 19th to November 13th, was storing on its prior appropriation. Since that date Lake Cheesman has been discharging about 20 second feet from storage, to supply the shortage in the river for the domestic use of Denver and for power purposes of the flour mill at Littleton.

Although the law of 1911 requires that each Division Engineer shall be provided with a suitable office, furniture and office equipment for the proper transaction of business, this office is still without a permanent abiding place and a telephone.

I hereto attach the regular statutory tabulation of the Water Commissioners' annual report.

Respectfully submitted,

(Signed) F. COGSWELL.

Irrigation Division Engineer, Irrigation Division No. 1.

IRRIGATION DIVISION NO. 1

THE WEEKLY REPORTS OF THE WATER COMMISSIONER OF DISTRICT NO. 3 SHOW THE FOLLOWING AMOUNTS OF WATER BROUGHT OVER FROM DISTRICTS NOS. 47, 48 AND 51, INTO DISTRICT NO. 3, DURING 1916.

	From Dist. No. 47 In Acre Feet	From Dist. No. 48 In Acre Feet	From Dist. No. 51 In Acre Feet	Totals
April	0	0	0	0
May	0	2,156	1,220	3,376
June	2,336	12,202	6,740	21,278
July	2,410	7,902	4,886	15,198
August	1,146	3,956	1,630	6,732
September	520	1,254	42	1,816
October	84	0	0	84
November	0	0	0	0
Totals	6,496	27,470	14,518	48,484
Stored in Dist. No. 3, less 5%..	0	2,876 In Chambers Lake, Wor- ster and Douglas Reservoirs	0	2,876
Used for direct Irrigation, less 5%	6,496 By North Poudre and Larimer County Ditches	24,594 By Larimer County and Poudre Val- ley Ditches	14,518 By Larimer County Ditch	45,608

NOTE.—In making this transfer of water 5 per cent. is deducted for loss in transit, except when stored in Chambers or Worster Reservoirs. 3,645 acre feet of the above were diverted from District No. 48 through the Greeley-Poudre Tunnel.

IRRIGATION DIVISION NO. 1—Continued
THE WEEKLY REPORTS OF THE WATER COMMISSIONERS SHOW THE FOLLOWING AMOUNTS OF RIVER WATER,
IN ACRE FEET, USED IN IRRIGATION DURING 1916.

District	April	May	June	July	Aug.	Sept.	Oct.	Nov.	Totals
1	36,120	30,836	24,964	20,910	32,378	32,790	38,970	6,600	223,568
2	17,750	47,798	54,130	47,462	55,619	36,899	22,712	4,820	287,190
3	7,556	63,412	108,790	54,328	31,514	16,482	2,240	0	284,822

Totals.....	Nov. 30	293	171	487,177

NOTE.—The quantities in column (10) represent the reported acre feet in the reservoirs on May 1, 1916, minus the acre feet reported in the reservoirs on Nov. 1, 1916, plus the acre feet diverted from the rivers for storage from May 1 to Nov. 1, as given in the weekly reports of the Water Commissioners, except in Districts 2 and 3 which are given as reported by the Water Commissioners.

District No. 8 also used 20,226 acre feet of water from Cheesman Lake and Antero Reservoir.

The "Annual Reports" of the Water Commissioners include many small reservoirs not included in their weekly reports. These quantities are, therefore, only approximate, but they are the only ones available.

District No. 2 includes storage in Standley Lake.

District No. 64 includes storage in Point of Rocks and Prewitt Reservoirs and in Julesburg Reservoir.

65	Not reported		3,015	942	580
Totals.....	9,302	2,033,756	1,611,754	297,723	193,166

NOTE.—The quantities given in columns (13) to (25) represent the total acreage that can be irrigated or was irrigated, whether the ditches only used the natural flow of streams, or only used reservoir water, or used river and reservoir water combined.

The approximate amount of water used in any district, except in Districts 2, 3, 7 and 8, will be found by adding together the "No. of Acre Feet Diverted by Ditches During Season from Natural Streams," given in column (12) and the "Amount of Water Carried from Reservoirs in Acre Feet," given in column (10).

In District No. 2, 1983 acre feet were diverted from Districts Nos. 5, 7 and 23. In District No. 3, 45,608 acre feet additional were diverted from Districts Nos. 47, 48 and 51, and used for direct irrigation. In District No. 7, 924 acre feet were diverted from District No. 51 and used by the Golden City and Ralston Creek Ditch. In District No. 8, 20,226 acre feet were diverted from District No. 23.

ANNUAL REPORT DIVISION ENGINEER
DIVISION NO. 2, FOR 1915

Pueblo, Colo., November 30, 1915.

Mr. A. A. Weiland,
State Engineer,
Denver, Colorado.

Dear Sir: I herewith submit my annual report for the year ending November 30th, 1915, for Division No. 2, together with tabulation of the Water Commissioners' annual reports.

Rains began in March, continued throughout the entire season, in such volume as to diminish irrigation very materially. More rain fell in this division than ever known in the history of the valley. Numerous heavy downpours of as high as two and a half inches.

Many disastrous floods on tributaries, but none of consequence on the Arkansas River. The rainfall far exceeded the normal.

Reservoirs were hardly called upon for water during the season, and it is most remarkable that nearly all go into winter full, something never chronicled before, guaranteeing an abundance of water for next season.

The normal flow of the streams, increased with the unusual rainfall, was ample for all purposes. In fact, this resulted in over-use or abuse of water to such an extent as to injure many crops and increase seepage. It is remarked that seepage will be the next and most serious problem to confront irrigationists.

The vast resources of this valley make of it an empire within itself. To say this valley is one of the richest in the world is far from exaggeration.

We have approximately 700,000 acres that can be irrigated, 550,000 irrigated, and of this amount 187,000 acres are in alfalfa. Since excessive rain injured the crop to some extent, we will place the average yield at three tons per acre; 561,000 tons at a minimum of \$6.00 per ton, gives \$3,366,000; 65,000 acres of sugar beets at a minimum of 13 tons per acre, 845,000 tons, gives \$4,225,000. The beets were very high in sugar content, so that many brought \$7.00 per ton. Fifty-two thousand acres blue stem or wild hay at a minimum of one ton per acre, 52,000 tons at \$12.00 per ton, \$624,000. Beside the above, 12,000 acres of cereals, 15,000 acres in orchards, 5,000 acres of melons and 6,000 acres in market gardens, and the balance in bush fruit and diversified crops.

I shall use this in a primary way. Under consumers I will place the four sugar factories, condensed milk plants and canning factories, alfalfa meal mills, creameries and cheese factories. Each in its line consumes the products of the farm and enriches the valley by hundreds of thousands of dollars. Each of the above was taxed to fullest capacity during the past season.

Fremont is the banner apple county, with Otero, Pueblo and Crowley close seconds.

From the best information at hand, the value of apples, peaches, cherries, prunes, together with bush fruits, reach well into six figures.

Vegetables of many varieties are shipped into the surrounding states, and much to the far eastern market. There will be many cars of celery shipped, which is one of the best paying crops, often yielding as much as \$1,100 per acre.

Thousands of acres are planted for seed crop alone, such as cucumbers, squash, and melons.

I am reliably informed that over one-half million sheep will be fed in this valley the coming winter, besides thousands of cattle, at each sugar factory. The dairy industry is fast growing throughout the entire division. In District No. 67 it is becoming the leading industry.

The constant high water from so much rain has kept busy an expert hydrographer. The shifting current, carrying great quantities of sand into the ditches, changing the course of the river from one side to the other, has made the presence of this hydrographer a necessity; without his assistance it would have been difficult to administer the water of the division.

I do not recall a single complaint in any district in the division, or from any water commissioner, save one, and that was between the Holbrook and Meredith reservoirs, as to their priority to exchange stored water with the river.

Respectfully,

(Signed) E. R. CHEW,
Irrigation Division Engineer, Division No. 2.

IRRIGATION DIVISION NO. 2

TABULATED STATEMENT OF WATER COMMISSIONERS' ANNUAL RESERVOIR REPORTS FOR THE IRRIGATION
SEASON OF 1915.

District	Name of Reservoirs Reported	Source of Supply	Capacity in Cubic Feet	Quantity of Water in Reservoirs May 1, 1915, Cubic Feet	Quantity of Water in Reservoirs Nov. 1, 1915, Cubic Feet

ANNUAL REPORT DIVISION ENGINEER
DIVISION NO. 2, FOR 1916

Pueblo, Colo., December 8, 1916.

Mr. A. A. Weiland,
State Engineer,
Denver, Colorado.

Dear Sir: I herewith submit my annual report.

The season opened extremely unfavorable, and continued so late into May, the ground being wet and cold, seed failed to germinate readily, and resulted in much replanting.

There was but little rainfall after May. This was one of the driest seasons ever known in the valley; in fact, there was but little rain until August, and that during the latter part of the month. The rainfall for May was 0.63 inches; June, 1.22 inches; July, 0.83 inches, and August, 3.12 inches.

However, the ditches drawing from the Arkansas River were sufficiently supplied, and splendid crops were produced thereunder. The tributaries did not fare so well. As they were very low, or dry, crops suffered, and many failed for lack of water.

There were no floods in either the Arkansas River or its tributaries, and very little above normal at any time during the season. The grazing lands suffered.

Dry farming showed varying results. For instance, in some sections fine crops, some very light, and in other sections a total failure. I attribute this not merely to lack of rain, but earth conditions.

There has not been sufficient water for storage at any time during the season.

I am often asked, "What is the duty of water?" The duty of water for irrigation is the amount of land a given amount of water will irrigate successfully in the growing and maturing of any particular crop.

There was never a better demonstration than this season, proving that in past years over-irrigation had been indulged in to the detriment of crops, and land injured and water-logged to a marked extent. In my long experience I have noted that the years when water was scarcest and had to be most economically used, better crops resulted.

There was planted to sugar beets 53,120 acres, yielding at a minimum 10 tons per acre, or 531,200 tons, at the minimum price of \$5.00 per ton, distributed to the growers \$2,656,000. In alfalfa 187,986 acres, at the lowest estimate three tons per acre. We have 563,958 tons, at the moderate price of \$10.00 per ton (now \$16.00), we find the farmers receiving the handsome sum of \$5,639,580. There were over 4,000 acres of melons. Some growers report

\$800.00 per acre, noticeably from the now famous "Honey Dew" melon.

Some 3,500 acres Mexican beans, yielding from 500 pounds to one ton per acre, worth a market value of six cents per pound, the great difference attributable to several causes,—want of irrigation at the proper time, and cultivation; and to the dry farmer, lack of rain and cultivation are the most prominent causes.

Besides the above there were 50,000 acres wild hay, or natural grasses, at one ton per acre, and now worth \$22.00, or \$1,100,000. Success in growing and producing, like everything else, depends upon the "man behind the gun," absolutely.

Fruit crop in general was not up to normal.

The market gardeners were successful. The high prices obtained made a banner year for all truck gardening.

The usual number of cattle and sheep are being fattened, not only in the feeding pens of the sugar factories, but throughout the valley.

I would recommend a general revision of the irrigation law, particularly all that relates to reservoirs and its relation to canals. The law is now a confusing tangle. To enter upon any particular part would take more space and time than is accorded me. But every lawyer and user of water for irrigation, I believe, will endorse the above.

The division engineer, being the head of a department, should be held as other officers of the state, having full and complete supervision over the affairs of his division, accountable to the state. His report each year should be made to the State Engineer, and included in his published report. His salary and bills of expense should go to the Auditing Board direct, or to the State Auditor, and under oath.

The water commissioners in each district should be appointed by the Governor, upon the recommendation of the division engineer of that division. They should receive a fixed sum per year, paid by the state, and the division engineer should be vested with authority to discharge any water commissioner at any time he may deem it necessary. All deputy water commissioners should be required to give a good and sufficient bond. They should receive \$3.00 per diem, for days actually worked. All salaries of water commissioners and deputies should be approved by the division engineer.

The division engineer should be empowered to send a water commissioner, or his deputy, into any district of his division for the performance of any duty he may deem necessary.

The time should be extended to December 1st for the water commissioners' reports, as they fail to get them in by the 15th of November, claiming they cannot procure the necessary data.

Appeal from the decision or ruling of the division engineer should be made direct to the courts, and not elsewhere.

A permanent office should be furnished the division engineer, equipped with everything needful or necessary for the maintenance of such office. The equipment would be incomplete without a competent stenographer. Not only is there ample work, but one is needed in the office at all times.

To administer the affairs of the office as they should be, the division engineer should be thoroughly acquainted with every stream, ditch and reservoir in his division, and in order that he may have this knowledge he must personally acquire same. This necessitates his absence from his office much of his time. There should be a competent hydrographer stationed in his office, as he is most valuable and necessary. His service is demanded constantly throughout the entire year. Every user of water will recognize both the above as necessary.

This has been a most strenuous year for the farmers and myself. We bow with reverence to our Supreme Maker for his watchful kindness in our needs, and heartily thank all those who assisted in our work.

Respectfully submitted,

(Signed) E. R. CHEW,
Irrigation Division Engineer.

ANNUAL REPORT DIVISION ENGINEER
DIVISION NO. 3, FOR 1915.

Alamosa, Colo., November 30, 1915.

Hon. A. A. Weiland,
State Engineer,
Denver, Colorado.

Dear Sir: I have the pleasure of handing you herewith my annual report of ditches and reservoirs for the fiscal year ending November 30th, 1915, for Irrigation Division No. 3, comprising the eight districts in the San Luis Valley and covering the drainage basin of the Rio Grande Del Norte River and its tributaries.

As I did not assume the duties of office as Irrigation Division Engineer until the first of August last, the heavy irrigation was practically over, so that since that time there has been very little trouble in the distribution of water.

There has been no extreme high water during the season just closed in any of the districts, but a steady flow, which supplied all demands and assured good crops in the entire division. During two or three days in July it was necessary to close several of the late priorities; however, it did not last long, as heavy rains in the mountains soon increased the flow of the streams.

The valley has had a very prosperous season, with an abundance of water for all priorities and crops well matured. Thousands of cattle, sheep and hogs are being fed and wintered here, and many more shipped in from other sections. The acreage of crops increases each season as more land is being developed, and in some sections large sums of money are being spent in the reclamation of seeped areas, which in itself speaks for prosperity.

I have covered several districts thoroughly to ascertain the condition of headgates and measuring flumes for the purpose of bettering the system of distribution in the division, and find there are only sixty-two ditches rated in the entire division. Of these ratings thirty-three were made during the season just closed. This is due to the fact that in nearly all cases the owners may have constructed good headgates, but have failed to provide a suitable measuring flume for rating. This condition prevails for the reason that there has been an abundant supply of water most of the time for several seasons.

Notices of the laws relative to headgates and measuring flumes have been served in all districts, followed up with letters from the office of Irrigation Division Engineer, and especially to water users in Districts Nos. 21 and 26, with a result that during the fall there has been heavy expenditure in putting ditches in shape in those districts for the next season. The same procedure will be taken in the other districts next year, as it is advisable to get all ditches

rated, when new measuring flumes are installed, and establish good systems of distribution for those water users, thereby showing the good faith of the officers in charge of the distribution of water, to protect the rights of all water users who have complied with the law.

Water commissioners were appointed in all the districts this year, and assumed their duties a little late in the season, but have done exceptionally well for new men at the work. They have had very little trouble with the water users, and have kept good records of the amount of water distributed since assuming their duties; however, it has been very hard for them on account of the lack of proper measuring devices. It is impossible for them to keep accurate records and properly distribute the water to the water users who fail to comply with the law, especially in maintaining measuring flumes. Most of the controversies that arise cover the amount of water carried in ditches, and usually it is the water commissioner, and not the water user, who gets the blame. This condition will probably be eliminated in a year or two, as the majority of the water users are putting their ditches in the proper shape to receive the appropriations of water to which they are entitled.

I also find that the prevailing opinion among water users is to the effect that they may regulate their headgates whenever they so desire. No matter how hard a water commissioner may work for the best interests of all concerned, he cannot do his duty as such commissioner unless he knows what each ditch is carrying, and this can only be accomplished by complying strictly to that section of the laws covering the regulation of headgates. This is especially true where the waters of a stream have been over-appropriated, and a reservoir is located at the head of the stream. The water commissioners have experienced a great deal of difficulty over this question, and even have to provide their own locks to control the gates.

The reservoirs in the division have had a very good supply of water during the season, all of which was not demanded. With a few exceptions, all of the reservoirs are in good condition and storing at the present time. Others are being repaired, and storing as much water as possible. If these reservoirs do not fill before spring they will be able to do so at that time. At present there are sixteen reservoirs in the division, and one being constructed on the Costilla River.

In the districts where we have commenced our work of enforcing the laws relative to measuring flumes, it has been necessary for the water commissioners to spend extra time in regulating the water, serving notices, etc. The expense of such work has caused a large amount of protest from the county commissioners, who can see no reason for such expenditures. They are inclined to blame the water commissioners rather than the taxpayers themselves, who are the water users and the people responsible. Such expense will be unnecessary when a good system has been established.

I wish to mention the valuable assistance given this office by Mr. H. D. Amsley, Hydrographer from the State Engineer's office, who has spent the entire season in this division. Through him records have been kept on eight river stations, where measurements have been regularly made. Aside from this work he has made thirty-three complete ratings on ditches, half the entire number in this office at the present time. A large number of check measurements were also made. These stations are so located that his measurements and the station gages have been of great assistance to the several water commissioners in determining the amount of water in the streams for their distribution.

In conclusion, I desire to thank the State Engineer for his courteous treatment and advice on all matters pertaining to this office. Also, the several water commissioners in this division, as they have all been active and faithful in the discharge of their duties, giving at all times as accurate information as possible under existing conditions.

Respectfully submitted,

(Signed) D. A. NORTON,
Irrigation Division Engineer, Division No. 3.

ANNUAL REPORT DIVISION ENGINEER
DIVISION NO. 3, FOR 1916.

Alamosa, Colo., November 30, 1916.

Hon. A. A. Weiland,
State Engineer,
Denver, Colorado.

Dear Sir: I have the pleasure of handing you herewith my annual report of ditches and reservoirs for the fiscal year ending November 30th, 1916, for Irrigation Division No. 3, comprising the eight districts in the San Luis Valley, and covering the drainage basin of the Rio Grande Del Norte River and its tributaries.

The supply of water during the season just closed has been very good for a greater part of the division, only a few of the smaller streams being short. The flow of water was steady throughout the season, regardless of the fact that the first rains did not commence until the middle of July. For the following six or eight weeks these rains continued throughout the division, both in the valley and in the mountains, supplying sufficient water for the irrigation of crops.

The division as a whole is in a very prosperous condition, with a substantial increase in acreage under cultivation, as well as a large increase in cattle, sheep and hogs, which are being wintered and fed for market. High prices for grains, hay and potatoes have been of great financial benefit to the division, especially the potato crop, which netted many of the farmers as high as \$200 per acre.

The development of drainage for the seeped lands has gained during the past season. The sections already drained have proven, beyond a doubt, the benefits to be derived from drainage. Lands that prior to being drained would not raise a crop of any kind are now raising excellent crops of small grains, alfalfa, potatoes and peas. At the present time there are seven drainage districts formed, varying in size from 5,000 to 30,000 acres, which means that within a short time many thousand acres will be added to the present crop acreage. Of these seven districts, three have been drained and are working successfully. In two districts drainage is under way and will soon be completed, while the sixth district, comprising about 10,000 acres, has recently sold its bonds, and will commence the drainage of its lands next spring. The seventh district is preparing to dispose of its bonds. Two of these districts, of some 14,000 acres, are being drained by individuals, while the balance are bonded districts. The cost of drainage is varying from \$9.00 to \$12.00 per acre, depending on the length of outlet ditch and length of secondary lines to properly drain the district, but in no case has the cost exceeded \$12.00 per acre. Water developed by means of this drainage is being used, in some cases, on other lands in the irrigation of crops, while in other instances it goes directly to the streams for the benefit of the rights on that stream.

In going over the several water districts I find the condition of headgates and measuring flumes much better than last year, with a gain in the efficient regulation of the water. Some 225 measurements were made on ditches, and rating cards for these ditches were furnished the water commissioners and owners. In all cases where ditches were rated we found the condition of the ditch to be good; however, owing to the number of ditches to be rated we were unable to get them all. This work will continue as rapidly as possible for the purpose of getting a more efficient and beneficial distribution of water.

This office has continued and will continue to send out notices of the laws relative to headgates and measuring flumes, and in addition has taken up the changes of points of diversion which are necessary in the several districts. The officials have been quite successful in these matters, and a number of the districts are in much better shape than for several years. The most marked change is in District No. 21, where, by next year, every ditch will have a good headgate and measuring flume, and most of them will have a rating card for the ditch. Practically all measuring flumes were in the ditches this year, but this office was unable to take all the measurements necessary to get them rated.

The water commissioners have handled their districts in good shape during the season just closed. The supply of water was such that very few controversies arose; however, these commissioners were always at their work and giving good service to the water users. This being their second season, more efficient services were given and more accurate records kept than last year.

The reservoirs in the division have had an excellent supply of water during the season. Because of the steady run of water in several of the rivers, it was not necessary to use all of the stored water, so that these reservoirs will carry over a good supply of water for the irrigation season of 1917.

I wish to mention the valuable assistance of Mr. H. D. Amsley, Hydrographer from the State Engineer's office. He was in the division from the 1st of April until the 23rd of November, keeping records and making measurements.

In conclusion, I desire to thank the State Engineer for his advice and treatment of all matters which have come up in this division. Also, the several water commissioners, who have been faithful in the discharge of their duties, and have at all times rendered as accurate reports as possible.

Respectfully submitted,

(Signed) D. A. NORTON,
Irrigation Division Engineer, Division No. 3.

ANNUAL REPORT DIVISION ENGINEER
DIVISION NO. 4, FOR 1915.

Montrose, Colo., November 29, 1915.

Mr. A. A. Weiland,
State Engineer,
Denver, Colorado.

Dear Sir: I herewith present my report of Irrigation Division No. 4 for the fiscal year ending November 30th, 1915.

The season was the driest one we have had for several years. The snowfall in the mountains was very light, yet, owing to the cool spring, the streams held up later in the summer than was at first expected. There was no high water in the various streams, as the snow in the mountains melted very slowly. From July to November, inclusive, was one long, dry period. So low did the Gunnison River get above Delta, below the Gunnison Tunnel, and there was so little water left in the river after supplying the Gunnison Tunnel, that tons of fishes left the river bed and died in the irrigating ditches.

In Districts Nos. 40, 41 and 42, where new water commissioners were appointed rather late in the season, considerable difficulty was experienced by them in distributing the water. This was especially true in District No. 40, which is a very large district and one that is extremely difficult to handle. Before Mr. George Hider, the new commissioner, had time to qualify, they were demanding water in all parts of the district at the same time.

La Plata County had a greater amount of precipitation during the early part of the season than any other part of the division, and, as a result the commissioner of District No. 30 was not called out.

There has, in previous years, been more or less trouble in District No. 33 with incompetent water commissioners, but the present commissioner, Mr. O. J. Leggett, handles the water distribution in a very satisfactory manner.

The following order was issued to the water commissioner of this district:

Montrose, Colo., May 30, 1915.

Mr. O. J. Leggett,
Kline, Colorado.

Dear Sir: About a year ago notices were served on the various ditches in District No. 33 to put in headgates and measuring boxes. A recent visit to your district reveals the fact that the law has not been complied with, and that the notices have been disregarded.

You are hereby directed to again notify the following ditches, and such others as have not complied with the law, that unless they immediately put in the necessary head-

gates and measuring flumes, the law will be strictly enforced, and you are instructed to shut off all water in those ditches which do not comply with the law, and to keep the same shut off until such times as they meet the requirements of the law. The following is a list of the ditches and requirements:

Pine Ridge Ditch, new flume; Hay Gulch, cleaned out below and in measuring flume; Fort Lewis Ditch, flume; H. H. Ditch, timber across flume; Short Line, new headgate and flume; Traynor, repair headgate and put in new flume; Slade, new headgate; Townsite, flume; Joe Freed, flume; Sooner Valley, headgate and flume; Morgan, flume; Dale, flume.

If the ditches do not comply within fifteen days from the date of notice, you are directed to shut off all water in those ditches not complying, and notify me.

Very respectfully,

(Signed) H. C. GETTY,

Irrigation Division Engineer, Division No. 4.

Mr. Leggett informs me that the various ditches have complied with the above order, and, consequently, the distribution of water in this district will be less difficult than usual.

At the head waters of Surface Creek, in District No. 40, there are about 200 reservoirs, and, until recently, the distribution of the water from these reservoirs was a bone of contention to all water commissioners. The distribution of this reservoir water has been much simplified in recent years, by the organization of the Grand Mesa Water Users' Association. This association handles the water distribution of all the reservoirs in this locality, resulting in better service and less expense to water users, and a vast saving in water from evaporation, etc. The consolidation of all reservoir interests has been decidedly beneficial.

In District No. 41, which embraces all the Uncompahgre Valley in Montrose and Delta Counties, the U. S. Reclamation Service owned or controlled all the canals and important ditches except the Ironstone Canal. Prior to the year 1915, the U. S. Reclamation Service and the Uncompahgre Valley Water Users' Association made repeated attempts to unify all the ditches under the Uncompahgre project, but were unable to do so, owing to their inability to get control of the Ironstone Canal.

The lack of unification has in the past retarded the development of the valley to a very great extent. A contention between the Ironstone Canal on one side and the U. S. Reclamation Service and the Uncompahgre Valley Water Users' Association on the other, over the return water resulting from the use of water brought into the valley from the Gunnison River through the Gunnison Tunnel, was the cause of a great amount of strife and ill-feeling, and threatened to bring on endless litigation in the State

and Federal Courts. This calamity has happily been averted by the purchase of the Ironstone Canal by the U. S. Reclamation Service, which is now engaged in enlarging and extending the Ironstone system.

We think this unification will result very favorably for the valley, as it will unify the people as well as the canal system, will open up new lands to irrigation, cause new settlers to come in and help develop this vast empire, second to none in climate and productiveness, and increase the peace and happiness of water officials by removing the cause of their grief and vexation of spirit.

From Mr. Fred D. Pyle, Project Manager, we obtain the following facts relative to the progress made during the year on this most important irrigation project:

UNCOMPAHGRE VALLEY PROJECT—COLORADO

GENERAL PROGRESS

During the past year a permanent wooden flume was constructed on the South canal to replace the old temporary flume near Tunnel 5. Collapsible shutters were placed on the Gunnison diversion weir. A permanent connection was made between the West canal and the South canal, so that in the future the water supply can be drawn directly from the South canal when desired. This connection consisted of a concrete headgate and a semi-circular steel flume on steel girders, across the Uncompahgre River. A wasteway and underdrain was constructed on the Montrose and Delta Canal to provide for the future floods in Big Sandy. A feeder was constructed between Cedar Creek and the Loutsenhizer Canal. Construction work was commenced on a 20" wood stave siphon 1,800 feet long to irrigate the Boot Mesa from the Loutsenhizer Canal. The Selig Canal and lateral system was completed and seasoned, except for the Peach Valley lateral. The East canal lateral system was completed. Work was commenced on the enlargement and reconstruction of the Ironstone Canal and lateral system. The Garnet Canal system was taken over and reconstructed. Drainage investigations and irrigable land surveys were commenced. The Ironstone and Ironstone Extension Canal Companies were unified and the properties acquired by the Government. The Government now owns the Montrose and Delta, Chipeta, Loutsenhizer, Selig, Ironstone, Ironstone Extension and Garnet Canals, and has agreements to unify with the Boomer, Reservation, Highline, Logan, North Mesa, Homerun and Delta Chief Canals. It is expected that the canal and lateral systems will be practically completed by July 1, 1916.

RESULTS

The following is a brief summary of the results accomplished from July 1, 1914, to June 30, 1915: Miles of canal constructed—112; structures costing over \$2,000 each—9; costing from \$500 to

\$2,000 each—7; costing from \$100 to \$500 each—33; costing less than \$100 each—638. Number of bridges built—86; number of culverts constructed—30; number of wooden pipe siphons laid—2; length—10,324 feet. There has been excavated 567,843 cubic yards of Class 1 material, 20,536 cubic yards of Class 2, and 2,377 cubic yards of Class 3; 716 cubic yards of concrete were placed.

The above work has made it possible to deliver water to about 30,000 acres more than a year ago.

EXPENDITURES

The expenditures on the project from October 1, 1914, to October 1, 1915, amounted to \$422,657.05, of which \$288,561.32 was spent on construction work, \$60,613.02 on purchase of rights of way and unification, and \$73,482.71 on operation and maintenance. The receipts for rental of water amounted to \$60,628.37.

OPERATION

During the season of 1915, the Government operated the Gunnison Tunnel, South, West, Montrose and Delta, Loutsenhizer, Selig, East and Garnet Canal systems. The season was a very dry one, with considerable wind during the spring. While the snowfall was not heavy, the run-off was much better than was expected. The Uncompahgre River reached a flood stage for only a few days. There was only one small flood due to rains. This was on the east side of the river, and did some damage to the lower portion of the Selig lateral system. The rainfall and mean temperatures at Montrose were as follows:

1914	Season of 1914-1915		Five-year Average	
	Precipitation Inches	Mean Temperature	Precipitation Inches	Mean Temperature
October	1.52	45	1.25	48
November	0.15	40	0.36	38
December	0.74	23	0.82	22
1915				
January	0.94	18	0.71	24
February	0.48	31	0.60	31
March	0.10	37	0.73	39
April	1.31	52	0.78	49
May	1.53	54	0.99	57
June	0.91	63	0.90	64
July	0.22	71	1.16	70
August	0.64	69	1.04	69
September	1.03	61	1.11	60
Total	9.43		10.45	
Average		47		48

But little trouble was encountered in the operation of the project, except for sliding banks above the Montrose and Delta, near Happy Canon, and leaks through the concrete lining in the South Canal. The slides have not moved for several months, and extensive repairs will be made this winter to the South Canal lining.

Some difficulty was encountered in seasoning the Selig Canal where it climbs North Mesa, but this was overcome by drainage and the puddling of the canal section.

During August, September and October the flow of the Uncompahgre River varied from 60 to 100 second feet, and the Gunnison from 650 to 1,000 second feet. The maximum discharge of the tunnel was 660 second feet. For several weeks the discharge of the river below the tunnel was less than 35 second feet, which, with the return water from Redrock Canon, Crystal Creek, Smith's Fork and the North Fork, furnished ample water for the older priorities near Delta.

CROPS

The season was a particularly favorable one for wheat, oats, onions, corn and potatoes, and splendid yields were secured by the farmers. A frost on May 2nd and 3rd did considerable damage to alfalfa and apples. Some fields of alfalfa did not recover from the effects of this frost until the third crop commenced growing. As a result, the alfalfa crop was light and the prices range from \$5.00 to \$7.00 per ton in the stack. The fruit crop was only about 60 per cent of normal. The sugar beet crop is somewhat below normal. The approximate acreage of crop is given in the table. In addition to the crop area of 39,335 acres shown in the table, approximately 3,000 acres were irrigated by canals which rented Gunnison water from the Government.

GENERAL CONDITIONS

The general financial condition of the project is becoming better and there is a tendency on the part of those holding large areas of undeveloped land to divide them up into farms and sell on such terms that new settlers will have an opportunity to make good. There has been a remarkable growth of interest in livestock. Many farmers who had only two or three hogs a year ago, now have 50 to 100, and hogs are beginning to leave the project for the Denver markets in car lots. Considerable attention is being given to dairy cattle, about twenty silos were constructed during the year.

The Department of Agriculture has recently placed a field man on the project to assist the farmers with their livestock.

A new flour mill was completed at Montrose, and the Western Colorado Power Company has extended its line to Delta, and is furnishing power and light to the town of Olathe, and to many of the farmers along its transmission line.

CROP AREA IN ACRES OF LANDS UNDER GOVERNMENT OPERATED CANALS—UNCOMPAHGRE VALLEY
PROJECT, COLORADO.

Total	14,950	5,200	14,250	2,610	1,010	1,135	180	39,335

In District No. 42 the Grand Valley Project is in course of construction by the U. S. Reclamation Service, under Mr. J. H. Miner, Project Engineer.

The Grand Valley Project provides for the delivery of water from the Grand River by a dam located about eight miles northeast of Palisade, Colo., into a canal system on the north side of the river, for the irrigation of lands lying north and west of Grand Junction, Fruita and Mack, Colorado. About 42,750 acres will be supplied by gravity and 10,250 acres by electrically operated pumping plants to be located on the gravity canal.

The diversion dam is practically completed. It consists of a concrete weir with six movable roller crests, each ten feet high and seventy feet long in the river section, and one roller crest fifteen feet high and sixty feet long in the sluice-way. The nine intake gates each have openings seven feet by seven feet.

On the first six and one-half miles of the main canal, located in the canon of the Grand River, there are three tunnels, respectively 3,723, 1,655 and 7,292 feet long. The earth work on this six and one-half miles aggregates 370,000 yards of excavation, and 1,436,000 station yards of overhaul. This portion of the main canal is finished. The next thirty-eight miles of the main canal, extending to the East Salt Creek and involving 2,300,000 yards of excavation, was completed in September, 1915. The laterals to serve 15,000 acres east of Big Salt Wash were also constructed in 1915. The main canal and laterals east of Big Salt Wash have been primed to beginning the delivery of water for irrigation in the spring of 1916. On December 31, 1915, the project will be approximately sixty per cent completed. The construction of the works for supplying water to the pumping areas will not be undertaken until the gravity area is supplied.

For several years there has been a vacancy in the office of Water Commissioner in District No. 59, and the County Commissioners of Gunnison County decline, or at least have neglected to recommend anyone for appointment to this position. During the past season this district was very much in need of a commissioner, and this office was handicapped by having to perform the duties of Water Commissioner at a time when other portions of the division were demanding our attention. What an improvement there would be in the water service of the State if the Division Engineers had in their several divisions a certain number of assignable, experienced water commissioners who could be kept constantly on duty during the irrigation season, and who, when their services were not required in one district, could be sent to another adjoining district where their services were in demand. Why not have water commissioners appointed by the State Engineer, on recommendation of the Division Engineer, instead of being appointed by the Governor, on recommendation of Boards of County Commissioners, when the appointment would be made on account of the appointee's ability, and not on account of his "political influence"? Water, the greatest asset the state possesses, is distributed under the most inefficient system

imaginable. How long, O Lord, must the state be cursed by our present rotten, inefficient, political, cumbersome and expensive system? But recommendations are useless, "Ephriam is wedded to his idol."

In western Montrose County, District No. 61, the Paradox Valley Irrigation, Land and Development Co. has been rapidly pushing its projects towards completion. The feeder canal system, which takes the water from the LaSal Mountains in Utah to the Paradox Valley, has been practically completed. The storage capacity of the Buckeye Reservoir was doubled by increasing the height of the dam twelve feet, making the present storage capacity five thousand acre feet.

They are now installing the Broadhead valve in the reservoir outlet. This valve will enable the company to control the delivery of water from their reservoir with perfect ease, as it is the simplest, most efficient and easiest operated headgate on the market. The expenditures of the company for improvements during the past season were about \$25,000.00.

A controversy arose between this company and Mr. Sam Rowley, et al., over the right to the use of water brought into the state from Utah. The company has filings on various streams in Utah, among them being Two Mile Creek. They have been operating for several years, and have built an extensive canal system to divert the water into Colorado. A statement from Utah officials acknowledges their right to the water.

In District No. 62 a certain water user made us no end of trouble. He refused to comply with the law relative to putting in proper headgates and weirs or measuring flumes, and proceeded to take all the water his ditches would hold, regardless of the orders of water officials, and with absolute disregard of the rights of other appropriators on the stream. He even threatened to exterminate the water officials if they molested him in his attempt to make "dry farmers" of his neighbors. Our persuasive ability being no match for his pertinacity, we caused his arrest, and a vigorous prosecution by Deputy District Attorney George Hetherington, in the County Court of Gunnison County, resulted in his conviction, and a fine of \$100.00 and costs, amounting to about \$600.00, was the penalty he paid for his disregard of the statutes and of the orders of the water officials. This conviction may have some effect on many others who are disposed to question the authority of the water officials, and are inclined to disregard the rights of others. Our thanks are due to the State Engineer and his Deputy for the able assistance they gave us in upholding the dignity of the law.

The annual reports and field books turned into this office by the various Water Commissioners are discouraging, to say the least. Much of the information required, and to which the attention of the Water Commissioners was directed, is wanting. The field books have not been properly kept, and in all but two instances are absolutely valueless.

We are unable to understand how a Water Commissioner expects to be able to make out a proper annual report if he goes through the season, day after day, without taking daily data on the various ditches and reservoirs, or compelling his deputies to do so.

In closing this report I desire to heartily thank the State Engineer and his obliging deputy for their many acts of courtesy and for the loyal support they extended to this office.

Attached hereto is the regular statutory tabulation of the annual report of Water Commissioners.

Respectfully yours,

(Signed) H. C. GETTY,
Irrigation Division Engineer, Division No. 4.

ANNUAL REPORT DIVISION ENGINEER,
DIVISION NO. 4, FOR 1916.

Montrose, Colorado, November 29, 1916.

The State Engineer,
Denver, Colorado.

Dear Sir: I have the honor to present you my annual report of Irrigation Division No. 4, for the fiscal year ending November 30, 1916.

From the standpoint of the farmer this year was exceedingly prosperous. There was an abundance of snow in the mountains, which made an ample supply of water for irrigation purposes.

With the exception of the fruit crop and the first cutting of alfalfa, the crops were splendid. Late frosts did considerable damage to the fruit crop in some locations, also to the first cutting of alfalfa. In Mesa and Delta counties, where the fruit crop was fairly good, the fruit grower received excellent prices for his peaches. Grain, potatoes and sugar beet crops were never better, and the market was the highest. This was especially true in the Uncompahgre Valley, where the yield of potatoes was enormous and prices ranged from \$1.50 to \$2.25 per hundred pounds. The farmers in this locality were greatly handicapped by the shortage of cars.

Early in May two small reservoirs broke, but caused little damage. These were the Casement Reservoir on Unaweep Creek in Mesa County, and the Hanson Reservoir on Leroux Creek in Delta County.

The break in the Hanson Reservoir was caused by the owner's neglect to clear the spillway, causing the water to run over the dam. Fortunately the Bailey Extension Reservoir, which received the water, was empty, or much damage would have been done. As it was, much mud and silt was washed into the Bailey Extension Reservoir. The Hanson Reservoir should not be rebuilt unless a large outlet is constructed to take care of the surplus water in the spring.

By a strict enforcement of the law on the part of water officials, the flooding of the roads was reduced to a great extent. The water officials, co-operating with the County Commissioners and road overseers, prevented the excessive flooding of roads, as was the practice in the past.

The city attorney of Gunnison complained to this office and to the office of the State Engineer about the flooding of the cellars in the town of Gunnison, caused, as he thought, by the use of an excessive amount of water by the Hartman Ditch. During the irrigation season the cellars fill with water and cause considerable damage to property. On orders from your office a rating flume has been put in the Hartman Ditch so that the exact amount of water used by this ditch may be known.

A personal visit to the various clerks of the district court, and bringing the matter before the Board of County Commissioners, resulted in obtaining certified copies of some judicial decrees for this office and the office of the State Engineer, which had not heretofore been furnished.

This office is greatly indebted to Mr. Fred D. Pyle, Project Manager of the Uncompahgre Project, U. S. R. S., for daily reports sent to this office of the amounts of water in the various ditches taking water from the Uncompahgre River. A copy of the report is given below:

Last Priority filled by Water Commissioner, 30.

Waste-Discharge of Casner, Less Last 5 Ditches, 8.

A very important decision was handed down by the Supreme Court in reference to the Greeley and Loveland Irrigation Company vs. The Farmers Pawnee Ditch Company. In this case the court interprets a direct irrigation right to have been granted for a specific use, and for a like period of time, and no enlarged use can be made of this right and the same applied to storage purposes. This decision provides us with definite information to solve similar problems as they come up from time to time.

Some apprehension arose on the part of the Rio Grande Railroad and others in regard to the safety of Trout Lake, which is owned by The Western Colorado Power Company and situated at the headwaters of San Miguel River.

On September 11th the Deputy State Engineer and myself, in company with Mr. Clay, Manager of The Western Colorado Power Company, made an examination of Trout Lake. This examination did not result in any stop orders being issued against the reservoir, and it is believed there is no cause for alarm as to the safety of the structures incident to this reservoir.

In this division there are two important reclamation projects under the U. S. Reclamation Service, viz., the Highline or Grand Valley, and the Uncompahgre or Gunnison Tunnel. Mr. J. H. Miner and Mr. Fred D. Pyle, project managers, kindly furnished us with the following data relative to these important projects:

GRAND VALLEY PROJECT—COLORADO.

U. S. Reclamation Service
J. H. Miner, Project Manager

PROGRESS DURING CALENDAR YEAR 1916.

The Grand River diversion dam will be practically complete at the end of the year. The work accomplished on this feature has consisted of the installation of the operating machinery and power plant, dismantling of the construction plant, and disposition of used equipment.

On the canal system, the first 55 miles of the main canal has been completed. During the current year 9 miles of canal were constructed, involving the excavation of about 200,000 cubic yards of earth and shale, the construction of a number of cross-drainage structures and flumes, and the erection of 4,000 linear feet of 60-inch wood stave pipe. Laterals have been completed to cover 14,500 acres in the first district and 10,000 acres in the second district. Laterals to serve the lands in the third district are now under construction.

During the season of 1916 water was supplied on demand to all lands in the first lateral district desiring to use it. About 2,000 acres were actually irrigated. It is expected that at the beginning of the season of 1917 facilities will be completed for supplying water to 35,000 acres. On December 31, 1916, the project will be about 67 per cent complete.

UNCOMPAHGRE VALLEY PROJECT—COLORADO.

Fred D. Pyle, Project Manager

United States Reclamation Service

October 1, 1916

GENERAL PROGRESS

During the past year a 20-inch wooden stave siphon 1,800 feet long was constructed to irrigate the Boot Mesa from the Loutsenhizer lateral system. The Peach Valley portion of the Selig lateral system was completed. The Ironstone canal was enlarged from a capacity of one hundred second feet to a capacity of three hundred eighty second feet. The lateral system on Ash Mesa was completed and plans made for the reconstruction of the California Mesa lateral system. Drainage investigations and the irrigable area surveys were continued. The Government now owns the Montrose and Delta, Chipeta, Loutsenhizer, Selig, Ironstone, Ironstone Extension and Garnet canals. It has agreements to unify with the Boomer, Reservation, High Line, Logan, North Mesa Homeruñ, Colorow and Delta Chief canals. The construction of the distribution system is practically completed, except for the California Mesa lateral system, which will be reconstructed this winter.

RESULTS

The following is a brief summary of results accomplished from July 1, 1915, to June 30, 1916:

Miles of canal constructed.....	21
Structures costing over \$2,000 each.....	5
Structures costing from \$500 to \$2,000 each.....	17
Structures costing from \$100 to \$500 each.....	52
Structures costing less than \$100 each.....	685
Number of bridges built.....	81
Number of culverts built	69
Number of wooden pipe siphons (1,727 feet long).....	1

There has been excavated 345,757 cubic yards of Class 1 material; 10,392 yards of Class 2, and 1,735 cubic yards of Class 3, and 2,308 cubic yards of concrete have been placed. The above work has made it possible to deliver water to a total of 80,000 acres, of which amount 54,400 acres were in crop this year.

EXPENDITURES

The expenditures on the project from October 1, 1915, to October 1, 1916, amounted to \$343,545.45, of which amount \$143,680.90 was spent on construction work, \$103,469.53 on purchase of rights of way and unification, and \$96,395.02 on operation and maintenance. The receipts for rental of water amounted to \$78,041.25.

OPERATION

The season was somewhat backward, the last frost occurring on May 15th and 16th, which did considerable damage to the fruit and alfalfa. The snowfall was not heavy, but the run-off was very good. There were no floods from melting snows. Rains commenced on July 25th and continued the remainder of the season. Several floods in the river and canal systems were caused by rains, but no damage was done. Project water was delivered on a rental basis of \$80 per second foot continuous flow for the season. This is a wasteful method of water delivery, and some change to a rotation system will be needed in the future.

But little trouble was encountered in operating the project, except for the sliding banks on the Montrose and Delta, Ironstone and Selig canals, and the settling of short portion of the concrete lining in the South canal. During August and September the flow of the Uncompahgre River was never less than one hundred second feet, and for considerable periods was greater than two hundred fifty second feet. The minimum flow of the Gunnison River was about six hundred fifty second feet during the latter part of September. During the time of heavy irrigation, it was always in excess of one thousand second feet. The maximum discharge of the Gunnison tunnel was seven hundred second feet. The water supply was ample during the entire irrigation season. It is estimated that six acre feet of water was delivered to the water users for each acre of land in crop.

GENERAL CONDITIONS

The financial condition of the project farmers has been greatly improved during the past year by good yields and good prices, and the large increase in the livestock industry. Several carloads of Holstein cows have been brought in and arrangements are being made for several more cars. Excellent results have been obtained by the farmers engaged in growing and fattening hogs. About fifteen new silos were built during the summer. The farmers have been assisted in their livestock industry by Mr. Lindgreen, of the Department of Agriculture, who was assigned to this project about one year ago. The prospects are very bright for the construction of a sugar beet factory at Delta in time to handle the 1917 crop.

The reports of Water Commissioners are anything but encouraging. I had earnestly hoped and expected that the water commissioners would have excellent reports, complete in every detail. They were notified by your office, as well as by circular and personal letters and personal talks. Besides this, the following circular letter was sent to each:

"April 4, 1916.

"To All Water Commissioners,
"State of Colorado.

"Gentlemen:

"It is earnestly hoped that each and every water commissioner will seriously endeavor this coming season to efficiently administer his district to the very best of his ability. Complete, accurate and detailed annual reports are required from all Water Commissioners on November 15th each year, covering the administration of their district for the past season.

"Dependable annual reports cannot be submitted unless facilities exist for accurately determining the actual amounts of water diverted from the public streams by the various ditches and reservoirs in your district. The statutes provide for this exigency. You will note the law says—'Owners * * * shall erect and maintain * * *. If the owner * * * shall fail or neglect to erect * * * the Water Commissioner * * * shall refuse to deliver any water * * *.'

"Owners and all Water Commissioners must realize that an efficient water administration is demanded, and the provisions of the statutes must be strictly complied with by all.

"A. A. WEILAND,
"State Engineer."

District No. 28 made no report, the Water Commissioner making the foolish excuse that a letter to your office was unanswered, and that his report would not be complete. A personal letter from this office, dated July 17, 1916, gave him ample instructions.

District No. 30 made no report, the Water Commissioner claiming he had no blanks or field books.

The reports for Districts Nos. 40 and 41 are not finished, but will probably be at some later date.

There is no report from District No. 59, as the Water Commissioner was not called out.

The report from District No. 60 is very incomplete, as the Water Commissioner worked but little and had other business to attend to.

The report from District No. 62 is as good as is possible under the circumstances, as is also the report from District No. 68.

The manner of appointing and paying Water Commissioners should be immediately changed. Must the office of Water Commissioner remain forever a sinecure?

RECOMMENDATIONS

That an appropriation be made by the next General Assembly to enable the Secretary of State to furnish Division Engineers' offices, as the statutes say he shall.

That a hydrographer be furnished this division for at least three months each year, to assist in rating the ditches and canals in the division.

That the present law relative to appointing Water Commissioners be repealed by a statute giving the State Engineer power to appoint on recommendation of the Division Engineer. That if Water Commissioners cannot be paid by the state, then they be paid by the county in which the work is performed; and all vouchers for paying Water Commissioners should first be certified by the Division Engineer. That all Water Commissioners shall be assigned to their work by the Division Engineer, and may be sent into any water district in the division. That the Division Engineer shall have power to discharge, or at least to suspend, any Water Commissioner neglecting or failing to perform his duties.

If this recommendation were enacted into the statutes the results would be far reaching in this division. It would mean greater efficiency and less expense. It would mean that Water Commissioners would be appointed for their ability to distribute water, and not because of their "political pull." It would mean that a Water Commissioner would not be on the pension list, a parasite on the taxpayers, and occupying an office which he does not fill; and who knows nothing about the duties of Water Commissioners and cares less. It would mean that a system of records would be kept which would be of inestimable value to water users. Why not have a more efficient, less cumbersome and less expensive system? A change is greatly to be desired. Why not make it now?

Attached hereto is the tabulated statement of the Water Commissioners' reports.

In closing I desire to thank you for the many acts of courtesy, and for the excellent support you have always given this office.

Very respectfully,

(Signed) H. C. GETTY,
Irrigation Division Engineer, Division No. 4.

ANNUAL REPORT DIVISION ENGINEER,
DIVISION NO. 5, FOR 1915.

Glenwood Springs, Colo., November 30, 1915.

Hon. A. A. Weiland,
State Engineer.

Dear Sir: I herewith submit my report for the year 1915, Irrigation Division No. 5.

The irrigation season of 1915 set in with dry, cool winds and sporadic rains, varying locally with occasional showers, quickly followed by a premature heat. In one district, No. 37, in two valleys the low temperature at night foiled the attempt of the irrigators to profit by the abundant water supply during the day, and as a consequence the first hay crop was subnormal, and, in several instances, almost a failure.

As marked contrasts I mention the isolated case of four ranches on the Eagle River, their location affording protection from the cold winds and sudden changes of temperature, which produced a maximum hay crop—four tons of alfalfa per acre from the first cutting. On several ranches on Gypsum Creek, eleven miles west of the Eagle ranches, the first crop of alfalfa, chilled by early and night irrigation, and stunted by a few weeks of dry heat following, was left uncut.

Throughout the division the climatic changes during the months of April, May and part of June were sudden and not conducive, in general, to a healthy growth of crops. The total result is not as satisfactory as was expected, especially when compared with that of 1914. Many individual irrigators did not seem to take economic advantage of the water supply when it was most available, and, as a consequence, suffered as the season advanced.

This state of affairs gave, as is usual in such cases, rise to complaints and unpleasant differences among irrigators, and caused strictures upon the action of the Water Commissioners who endeavored to adjust matters.

The commissioner of District No. 37 came in for his share of just objections, as he, in a misapplied sentiment for what he conceived to be his discretionary authority, apportioned water to certain appropriators at a time when they were not entitled to it and when senior appropriators actually needed the water, but "*when the former needed it worse,*" and it took some time to make him understand the difference between the dates of decrees and his personal judgment.

The subject of judicial apportionment of water to a given area is one of the greatest importance. While I can speak only within the scope of this report, I cannot refrain from suggesting a thorough investigation by the State Engineer, backed by the necessary legislative appropriation, for the purpose of modifying

the procedure of using unalterable proportions between water and area, just because that proportion has been applied in this division, say, as early as 1881.

More than a quarter-century of irrigation experience in this vicinity has convinced me that the majority of over-irrigated ranches become gradually leached and water-logged, to the detriment of quantity and quality of crops, and that it is not good practice to apportion water in a pre-determined ratio to all kinds of land, whether hilly or on flat ground, regardless of altitude, contour, remote from or adjoining gravelly creek beds with consequent sub-irrigation, on open or tight, "skinny" or deep soil, and, more especially, with respect to longer or shorter periods of previous application.

Argument on these points is barren of results. The irrigator wants his pound of flesh, or water, and would rather waste the priceless liquid than to let his neighbor have at least part of it. Many irrigators simply think that partial or total non-use of water, for even a portion of a single season, will be claimed as proof of abandonment of their priority. The exceptions in such cases merely prove the rule.

A reservoir decree on pages 320-322 of the book containing decrees for District No. 38, rendered prior to January 1, 1912, allows the petitioner, "*A sufficient quantity of water to keep said reservoir filled* to the capacity of one million, three hundred eighty-three thousand, four hundred four cubic feet of water for irrigation purposes," yet the quantity, about 31.8 acre feet, is seriously claimed to supply two hundred acres, which, as stated in the same decree, "are capable of being irrigated practically, and cultivated, by water from said reservoir."

Litigation threatened in this case. Attorney for the reservoir owners maintained that the 31.8 acre feet were meant to be subject to the wording of the above italic passage, i. e., that the reservoir could be filled and emptied and filled and emptied continuously from one end of the year to the other; he failed, however, to explain how the water was to be used at all if the reservoir was being *kept* filled, as distinctly stated in the decree. A settlement out of court was arrived at.

Another decree, in district No. 37, apportions all the surplus water in the creek over and above decreed rights existing at the time of its rendering to the first five priorities pro rata of their rights, thus virtually preventing any subsequent appropriator from enjoying irrigation privileges. I have in former reports referred to the uncertain results of jury trials in cases of unlawful appropriation of water, especially when locked headgates are raised, I should say certainty of acquittal. Two such cases were thus decided last season, although the offenses were clearly proven.

Again some poor victim of the consequences of literal application of the law suffers, when he is, humanely speaking, innocent of intent to do harm.

Cattle Creek was in this last season infected by beavers in its lower part and to take three cubic second feet down to the priorities, near the mouth of the creek, it was necessary to shoot out the beaver dams and channel the tortuous creek bed. This involved the labor of six men and two teams for nearly a week, and the creek then ran about fifteen cubic second feet. Subsequently a lone beaver couple returned and engaged industriously in restoring their home, and a rancher, fearing a repetition of the famine, killed one of them, forgetting or being ignorant of the necessity of first obtaining a permit from the game department. He was promptly arrested, tried, found guilty and fined \$25.00 and costs. I mention this fact because the victim in this case—the rancher, not the beaver—almost completely lost his crop on account of the beavers' activity, and is otherwise unable to procure the money to pay fine and costs.

There were no new projects or irrigation plants observable during 1915. Those contemplated previously received their share of local and other advertising, but without tangible results.

The Spring Park Reservoir owners in District No. 38 added considerable to their irrigated areas, and, having the advantage of a late beginning of season, could fill their reservoir to the 25-foot contour during the spring months, and furnish an ample supply throughout the season.

The Battlement Reservoirs, District No. 45, were also well supplied, and additional labor on dams and headworks was performed during 1915.

The Park Reservoir on West Elk Creek, District No. 39, has been successfully operated during the season, and the owners have added to the structure by better securing the sides of a spillway and widening the emergency ditch leading therefrom.

The sudden demise of the Water Commissioner of District No. 39, by a fatal accident while he was engaged in the performance of his duties, was followed by instructions to the deputy to assume charge of the office. The deputy has acted during the balance of the season, but, upon demanding field books and other property of the state of the administrator, for the purpose of making up his report, met with the objection that such property would only be turned over to the duly appointed successor of the deceased Water Commissioner. Up to this writing the books and other property belonging to the state are retained by the administrator, and I have been unable to obtain them. Under the law of 1903 I have assumed the office of Water Commissioner, and have made demand for this state's property now in the hands of the administrator; the probate judge has also supported this demand, and I hope to obtain the books, etc., in a few days, although too late for a complete report of District No. 39.

My recommendations with respect to a different method of appointing Water Commissioners are hereby repeated. The Water Commissioner is the judge of first jurisdiction, and, viewing the

importance of the irrigation industry in its proper light, the law should protect the actions of the commissioner to a greater extent than it does now, by giving his office more summary authority. To arrive at this point it is, however, necessary to select for this position men of known probity, skill and energy; to compensate them adequately and for a certain fixed period of the year, which should begin before and last after the real irrigation season, so as to give the commissioner time to examine his district before irrigation commences and to make his report after it ceases. The commissioner should be entirely freed from any kind of local influence, and should be paid from the state treasury direct. It is also conceivable that the deputy commissioners could do more effective work if their compensation was increased, even to the same figure which the Water Commissioner is paid, perhaps for a shorter period of the year. But both, commissioner and deputy, should be vested with the same authority and by special enactment. The number of deputies in each district should be commensurate to the extent of the area supervised. All commissioners and deputies should be placed under the direct authority and control of the Division Engineer.

It is with sincere appreciation of the courtesy of your office that I mention the fact that during the past season all communications from your office to the Water Commissioners were transmitted through the Division Engineer's office, thus preserving the succession of instances and thereby strengthening the hand of the officer directly above the Water Commissioner.

The subject of delegated authority to Division Engineers and Water Commissioners by special provisions of judicial decrees to the effect of committing to their care, authority and supervision of the supply to laterals out of main ditches, or the adjustment of individual rights in associated ditches, etc., is one of great importance. A conflict is created by such provisions between the intent of the law which limits such authority to the main headgate of the ditch, and execution of the decree, and I recommend that your office issue instructions to the officers of irrigation service clearly setting forth the full compass and limit of their authority in this respect. The State Engineer subsequently ruled that, in accordance with the statutes, Water Commissioners had no jurisdiction over the distribution of water from a ditch to its consumers. That decrees containing such provisions were not issued according to law, and that it was not incumbent upon Water Commissioners to obey such parts of these decrees.

Very respectfully,

(Signed) THEODORE ROSENBERG,
Division Engineer, Irrigation Division No. 5.

IRRIGATION DIVISION NO. 5.

SUMMARY ANNUAL REPORTS OF WATER COMMISSIONERS.

1915	Water District No. 37
Appropriations to ditches in cubic second feet.....	464.37
Capacity of ditches in cubic second feet.....	579.84
Length of ditches in miles.....	175.70
Length of laterals in miles.....	18.55
Water used from May 1 to October 1.....	
Average number of days of use of water.....	114.00
Average second feet of water during season in ditches.....	294.00
Total acre feet of water used during season.....	67,032.00
Total irrigated area in acres.....	19,167.00
Total irrigable area in acres.....	21,249.00
Duty (acre feet per acre).....	8.5

CROP REPORT

Alfalfa	10,390 acres
Natural Grasses	2,656 acres
Cereals	4,409 acres
Orchards	11 acres
Market Gardens	acres
Potatoes	1,771 acres
Other Crops	20 acres
Total	19,167 acres

RESERVOIRS

There were three of these in operation in this district, as reported by the commissioners; the Welsh, Christianson and Johnson Reservoirs, with 60, 29 and 102.5 acre feet capacity, respectively, which contained on May 1, 14.5, 11.63 and 22.77 acre feet, and were practically emptied on November 1. The ditches supplied are in the order named, the Alkali, Christianson and Eby ditches, used from June 1 to July 1, from July 1 to August 10, and from August 1 to August 30 in the above order to irrigate 260 acres, 220 in alfalfa and 40 in natural grasses.

1915	Water District No. 45
Appropriations to ditches in cubic second feet.....	823.40
Capacity of ditches in cubic second feet.....	504.71
Length of ditches in miles.....	369.00
Length of laterals in miles.....	111.48
Water used from April 6 to October 9.....	
Average number of days of use of water.....	79.00
Average second feet of water during season in ditches.....	412.00
Total acre feet of water used during season.....	65,096.00
Total acres irrigated during season.....	22,793.33
Total acres susceptible to irrigation.....	37,139.00
Duty (acre feet per acre).....	2.86

CROP REPORT

Alfalfa	15,673 acres
Natural Grasses	624 acres
Cereals	4,379 acres
Orchards	940.83 acres
Market Gardens	82 acres
Potatoes	774.5 acres
Sugar Beets	111 acres
Other Crops	229 acres
Total	22,793.33 acres

RESERVOIRS

The Battlement Reservoirs store the water of Battlement Creek near its head. They are owned by the Battlement Water Supply Company, and are used for irrigation of land on Battlement Mesa on the south side of the Grand River in Township 7 S., Ranges 95 and 96 W., 6th P. M.

The annual repair and maintenance assessment work on the reservoirs is done by the stockholders, generally during the fall, and, if the season is favorable, in the spring. There are six of the reservoirs.

No.	Area High Water Line Acres	Capacity Cubic Feet	Dam Length in Feet	Dam Height in Feet	Quantity of Water in Reservoirs May 1, 1915, Cubic Feet	Quantity of Water in Reservoirs Nov. 1, 1915, Cubic Feet
1	14.19	5,733,779	416	30	4,910,000	870,000
2	6.90	2,480,368	175	25	2,100,000	495,000
3	41.66	20,011,821	671	30	17,280,000	1,380,000
4	18.75	6,016,700	312	20	5,000,000	260,000
5	5.21	1,453,054	178	20	980,000	210,000
6	11.42	2,754,226	420	25	2,710,000	391,000

The dams of all these reservoirs are protected by riprap. The condition of all dams is satisfactory.

ANNUAL REPORT DIVISION ENGINEER
DIVISION NO. 5 FOR 1916.

Glenwood Springs, Colorado, Nov. 30, 1916. .

Hon. A. A. Weiland,
State Engineer,
Denver, Colorado.

Dear Sir: I herewith present my annual report for Irrigation Division No. 5 for the year 1916.

I believe this is the largest division in the state and I venture to say that the industries are more varied than in any other like portion of the state. Certain portions of the division are very difficult of access, or rather have been in years past, but with the great demand for road building and the advent of the motor car distances have been greatly overcome during the past few years. I have not traveled over the division as extensively and completely as I had hoped to do, but have given attention to every inquiry and have personally responded to every call made upon me where there seemed to be a real demand for my services. I will make but one exception to this statement, and that was in the case of a call from the country north of Craig, in Moffat County. I think this call would not have been made had there been a Water Commissioner in District No. 57. For several years this district has been without a Water Commissioner. I believe the County Commissioners ought to be urged to recommend to the Governor some suitable person for appointment as Water Commissioner for District No. 57.

The past year has been most satisfactory to farmers and water officials, there being less difficulty and fewer lawsuits over water than in any year within my recollection, but is has not been altogether favorable for one in search of statistical irrigation information.

The unusual snowfall of last winter and the very favorable climatic conditions of the spring and early summer were very encouraging to the farmers, and made it seem that there would be less use than ever for the services of the Water Commissioners. With this prospect in view County Commissioners, desirous of avoiding needless expense, urged the Division Engineer to use all precaution possible along this line and to make the administration as economical as possible, intimating that Water Commissioners' bills against the counties would be checked up with greater care than usual, and that the County Commissioners very much hoped for a reduction in the expenses of the services. I have, therefore, endeavored to conduct the business with the greatest economy possible, consistent always with the best service that could be given, but with the view only of eliminating any unnecessary expense. This perhaps will account for the lack of

completeness which will be found in the reports of some of the Water Commissioners who did not feel authorized to go into the various portions of their district excepting as their services seemed to be in demand. I find that nearly all of them have furnished good crop reports, as I insisted on special effort along this line. Their answers to questions 5, 6, 7, 25, 26 and 27 of the Water Commissioners' annual ditch reports I find are rather meager, due, I think, to the large extent of some of the districts and the inhibition put upon the commissioner against any work which County Commissioners did not deem to be absolutely necessary.

The crop conditions throughout Division No. 5 during the past season have been most excellent, and farmers are in a very prosperous condition. The extremely favorable season as to the natural precipitation and irrigation water have rendered the production of large crops a comparatively easy matter, and this fact, coupled with the abnormal prices, have combined to bring the farmer into a degree of prosperity which perhaps he has always deserved, but which he has seldom, if ever, attained to the degree which he is enjoying at this time.

DISTRICT NO. 37

This is a very fertile district comprising lands irrigated from the Eagle River, Gypsum Creek, Brush Creek and their tributaries, the district being almost entirely situate in Eagle County. The production of alfalfa, grain and potatoes has been considerably above the average during the past year. I visited the district twice, at one time making a very careful visit with the Water Commissioner of several of the streams and ditches. I have had no complaints or grievances from the territory and there has been no litigation so far as I have learned.

DISTRICT NO. 38

This district, watered from the Roaring Fork, Frying Pan and Crystal Rivers and from Cattle Creek and their tributaries, is one of the choice sections of Colorado. The streams are fed from snow that falls at a high altitude and short water rights are almost unknown, especially is this true of the two main streams of the district.

The production during the past year in this district has been highly satisfactory, and, in some instances, has been almost phenomenal. It is not unusual this year to find potato fields which will average better than two hundred sacks of one hundred and fifteen pounds each to the acre, and on the Sweet ranch, irrigated from the Crystal River, a field of ninety-five acres of potatoes gave an average yield of five hundred and twenty-nine bushels per acre, which at the present prices gives a monetary yield of \$814.15 per acre, or a gross price of \$77,344.25 for the field.

Wheat yields in this district have been little better than fair this year. Fall wheat of the Turkey Red variety has yielded from

twelve and one-half to thirty bushels per acre, while Defiance spring wheat has given a yield of from twenty-five to fifty bushels, a great many fields yielding better than forty bushels per acre.

DISTRICT NO. 39.

In this district there has been much litigation in the past, chiefly centered at Rifle Creek and in the Antlers country; but this year, due largely to the diplomatic conduct and energetic effort of the Water Commissioner, Mr. Isam W. Graham, there has been but little difficulty. I have been called out three or four times to assist Mr. Graham, and give advice on matters which came to his attention, but the difficulty was slight and was soon adjusted in each case.

DISTRICT NO. 43

This district comprises lands situate in the vicinity of Meeker and irrigated from White River and its tributaries. It is one of the best irrigated sections in the division, and the water officials have little or no trouble over the distribution of water. In fact, their services are so little in demand during ordinary seasons that it is usually very difficult to secure anything like an accurate statistical report from the Water Commissioners. I think Mr. Fisk has done remarkably well in that respect this year.

Stock growing is the chief industry in this district, and the people are in a very prosperous condition.

DISTRICT NO. 44

This district is watered from the Yampa or Bear River and its tributaries between the town of Craig and the mouth of the Little Snake River, and the water supply is usually abundant. This is also a stock growing section, and but little attention is given to crops other than hay and grain. Mr. Collom, the Water Commissioner, has not furnished me with an annual report, although I have only recently urged him to do so.

DISTRICT NO. 45

This district comprises some of the most fertile lands in Garfield County, the best portion of the district being situate along Divide Creek and being irrigated from that stream. While it has never been considered a well irrigated section, the farmers usually close the year with crops well up to the average, and this year has been no exception in that respect. Mr. S. B. Potter, the Water Commissioner, has been assisted in his work by four deputies, and it has kept them all very busy. The largest ditch in this district is one of comparatively recent construction and adjudication, but one which has meant much to the farming interests of that territory.

DISTRICT NO. 52

This is a small district on the Grand River and one from which I have heard but little during the season, but Mr. Rundell, the commissioner, has made an excellent annual report.

DISTRICT NO. 53

Mr. Macfarlane of this district has failed to file his annual report, but I have kept in close touch with him and his work during the year, and he seems to have had but little difficulty.

DISTRICT NO. 57

Included within the borders of District No. 57 are the towns of Hayden and Craig, and this district extends northward almost to the Wyoming state line. No Water Commissioner has been appointed in this district for many years, owing to the failure and refusal of the County Commissioners to make a recommendation to the Governor.

DISTRICT NO. 58

This is another high altitude section and stock growing in this district is very profitable. The seasons are short and only hardy and quick maturing crops are practical. Mr. Lansing, the Water Commissioner, submits a most excellent report.

DISTRICT NO. 70

This district is watered from Roan Creek and its tributaries, and lies in Garfield and Mesa Counties. Mr. Newton, the commissioner, has served in this capacity many years, and is thoroughly familiar with every phase of the work.

GENERAL OBSERVATIONS

I have stated elsewhere that there had been no litigation in the division this year. This is true so far as irrigation officials are concerned, and I believe I only recall one instance that has come to my notice of a person being arrested for appropriating water belonging to another. I find that heretofore Water Commissioners have yielded to requests to go down the ditches and settle disputes, and I have offended both consumers and commissioners because I refused to allow a continuance of this practice. I found the Attorney General's excellent opinion on this subject very helpful in the line of justifying my action.

In District No. 38 I had some trouble the past year, due, in part, I think, to the location of the district in relation to the Division Engineer's office, and the ease with which the water users could make their complaints to that official instead of depending on the Water Commissioner. In some instances the Division Engi-

neer was blamed for what the Water Commissioner did or failed to do, before the parties had even applied to the Water Commissioner for relief, the aggrieved coming to me before I had been made aware that there was any ground for complaint. However, the trouble did not assume serious proportions, and I mention it to show what difficulties may come to a Division Engineer through no fault of his own, where the water users and the Water Commissioner do not work harmoniously together.

SETTLEMENT OF NEW LANDS

While but little has been done in the way of ditch or reservoir construction in the division during the past year, much new land has been filed on and many people have come into the division to develop new homes, and I anticipate considerable irrigation construction during the coming year.

In the section contiguous to Craig, in Districts Nos. 57 and 44, this settlement of new lands has been especially noticeable the past year, but the most of this settlement is in what is known as the "Dry Land Belt," where irrigation will be extremely difficult and expensive, and can only be done in a practical way on a co-operative basis.

COMPLAINTS

I have had several complaints from parties in regard to reservoirs which were thought to be unsafe, the parties complaining in some instances believing their lives and property to be in jeopardy.

Upon investigating the matter I am satisfied that some small reservoirs have been constructed in this division that would not be in existence today had the laws requiring notice to the State Engineer and official inspection by him been complied with. However, I find that, whatever the conditions, the Division Engineer and the Water Commissioners are without power to interfere further than to report the conditions to the State Engineer.

RECOMMENDATIONS

I have heretofore made so many recommendations to your office that I think I will desist from that pastime this year, further than to reiterate my oft repeated statement that Water Commissioners should be appointed by the Governor or State Engineer, and paid for their services from state funds, and should be under more direct control and supervision of the Division Engineer than at present. I desire also to say that in these days of high cost of living the statutory maximum wage of \$2.50 per day for deputy Water Commissioners makes it a very difficult matter in some sections to secure suitable assistants for the water commissioners.

I desire also to refer to the recommendations of the Division Engineers adopted December 7, 1906, and found printed on pages 208 and 209 of the Thirteenth Annual Report issued from your office.

CONCLUSION

In conclusion I desire to acknowledge my thanks to your office for the many courtesies extended to me during the past year, and also to express my appreciation to the Water Commissioners for the loyalty and harmony with which they have co-operated with me in the service.

Yours very truly,

(Signed) A. J. DICKSON,
Irrigation Division Engineer, Division No. 5.

CHAPTER VI

EVAPORATION LOSSES FROM STREAM-BED RESERVOIRS.

The present State Engineer feels that the existing method of administering the rights of stream-bed reservoirs during the periods of non-storage is fundamentally wrong, and works an injustice on all ditches deriving their supply from this stream during this non-storage period.

At present a stream-bed reservoir is ordered not to store after a given date. From this time on, until the non-storage period ends, this reservoir is required to keep its gage height constant, except insofar as use of stored water is made from the reservoir in question. Undoubtedly this means that the reservoir, during its non-storage period, takes from the stream in question the quantity of water that is evaporated from its exposed surface. It is self-evident that all off-stream reservoirs must on account of their location, stand their evaporation losses during the non-storage period. When an off-stream reservoir is ordered not to store water, its inlet ditch is closed and no supply of water does or can go to offset the evaporation losses.

For the purpose of illustrating the question before us it may be well to give at this time the results of estimates which have been prepared to determine evaporation losses from Antero Reservoir and Prewitt Reservoir. The former is a stream-bed reservoir, located on the South Fork of the South Platte River, in Water District No. 23. The Prewitt Reservoir is not a stream-bed reservoir, and is located in Water District No. 64.

Since May, 1909, at which time the Antero Reservoir began storing the waters of the South Fork of the South Platte River, until January, 1917, a careful detailed estimate has been made of the evaporation losses sustained by this reservoir. This estimate shows that during this period a total of 56,000 acre feet of water was lost from the Antero Reservoir by evaporation.

An estimate prepared to determine the evaporation losses from the Prewitt Reservoir, covering the period from December, 1912, to October, 1915, shows that there was, during these thirty-five months, a total of 16,219 acre feet evaporated. These estimated losses in particular instances are only cited at this time to show that the problem is an important one, and should receive the serious consideration of the State Engineer in the administration of stream-bed reservoirs.

Assuming for the purpose of illustrating at this time that there is a stream-bed reservoir located on the headwaters of a stream which is fully appropriated during the growing season. This reservoir receives non-storage orders on May 1, and from that date until October 1 is not permitted to store any of the waters of

the stream in question. Assuming that this reservoir loses from its exposed water surface during a year 8,000 acre feet by evaporation, there would be, during the months of May to September, inclusive, five per cent of the total annual evaporation losses sustained, giving 5,200 acre feet as the evaporation loss during the growing season. During this period the direct right ditches deriving their supply from the stream in question have been deprived of 5,200 acre feet of water, assuming that there has not been at all time a sufficient quantity of water in the stream to supply the demands of the direct right ditches.

The present State Engineer feels that in justice to these direct right ditches, the stream-bed reservoirs should be charged with their evaporation losses during the period of non-storage, and that these reservoirs should be administered in such manner as to deduct evaporation losses during the non-storage period from the reservoir in question. It does not seem that it would be a very difficult matter to administer, for these stream-bed reservoirs could be required to lower their gage rods during the non-storage period a definite amount each week. This amount varies, of course, at different periods of the year, and on account of the variation which obtains in the rate of evaporation from a free water surface, due to local conditions and effecting factors, this amount would not be the same for the same month in different years. However, an average depth of evaporation for similar months could be adopted, and the variation from this average would in no instance work a hardship on either the reservoir or the direct right ditches.

With this problem in mind the present State Engineer undertook to compile and digest all of the available evaporation data which was a matter of published record. Compilation of all the existing data was undertaken and an attempt made to obtain a conservative figure for the annual depth of evaporation from a free water surface, which would be applicable to average conditions in Colorado.

In investigations of evaporation data quite a diversity of opinion is expressed by those conducting or reporting on the evaporation experiments. Many evaporation records vary to such an extent among themselves, even when the local conditions appear to be quite consistent and uniform, that one wonders just what data should be accepted and what discarded. It is axiomatic that the depth of evaporation from a water surface depends upon several different, definite factors. The relative temperature of the air and the water adjacent thereto is one of the important factors. The humidity of the air adjacent to the water surface affects materially the rate of evaporation. The dryer the air adjacent to the evaporating surface, the less will be the vapor pressure, and, consequently, an increased rate of evaporation will result. A most important factor affecting the rate of evaporation is the total wind movement across the evaporating surface. If the layer of air immediately adjacent to the water surface from which evap-

oration is taking place is changed continually, and a dryer air takes the place of the air which has in part received some of the moisture evaporated from the water surface, it is quite evident that a larger total loss by evaporation will be sustained from the water surface.

Two general plans have been followed in determining the loss from water surfaces by evaporation. The more common method has been what is known as the "land pan" observations, and the other and more desirable method the "floating pan" observations. The practical difficulty which must be contended with whenever the floating pan method is adopted probably accounts for the larger number of land pan evaporation records that are available.

Experiments have been conducted to determine the relation that exists between the loss in depth by evaporation from land pans and floating pans. At first thought it would seem probable that such experiments would indicate that the depth of evaporation from land pans would be greater than that from a floating pan in the same locality and under the same conditions. This does not seem to be the case, as has been found in digesting the available evaporation data. Some experiments have determined that the loss by evaporation from a floating pan was eighty per cent of the loss from a land pan. Others have arrived at results practically opposite.

Considering the various factors which affect the rate of evaporation, it does not seem probable that under the same and similar conditions the evaporation from a water surface, as that of a reservoir, can be greater than the evaporation from a land pan. The layer of air in contact with the water surface of the land pan certainly changes more rapidly and dryer air comes in contact with the evaporating surface than is possible if this water surface is larger, as that of a reservoir. Again, the temperature of the water in a land pan, on account of its small volume, is higher during those seasons of the year when the rate of evaporation is greater. Since the relative temperatures of the water and layer of air adjacent thereto, the total amount of wind movement and the humidity of this air, are the important factors affecting the rate of evaporation, and, since these factors all tend towards an increased rate when considered with the land pan, it is logical and is believed that the amount of evaporation from a free water surface, as that of a lake, is less than the evaporation from a land pan under similar conditions.

The relative loss by evaporation from a free water surface and the loss as measured in a pan floating thereon, has been experimented upon and discussed by different observers. Here again a diversity of opinion exists. There are, of course, practical difficulties incident to the installation and measurement of evaporation loss from floating pans. If the floating pan is installed in a protected part of the reservoir, the difference in local conditions may result in the floating pan evaporation loss being materially different than that from the free water surface of the entire reservoir.

It is not believed that it is probable or possible for the depth of evaporation loss from a floating pan to be materially different than the loss from the reservoir surface on which this pan floats. Unless there is some particular local condition affecting the pan in question which does not affect the reservoir surface, the two depths should be substantially the same.

The relative location of mountain ranges and their relation with reference to a reservoir may reduce the total annual evaporation loss from a water surface, by reducing the total amount of wind movement. A lower mean annual temperature obtains at higher altitudes, and for this reason the evaporation loss from a reservoir at a higher altitude would be less than from a similar reservoir located at a lower altitude.

However, high altitudes tend to increase the rate of evaporation on account of a reduction in atmospheric pressure and a relatively dryer atmosphere. In some instances certain reservoirs at high altitudes have a larger total wind movement than many plains reservoirs. Considering all of these different points objections can in each instance be made to applying any particular set of evaporation records to any other conditions except those under which they were obtained.

It is realized that with the stream-bed reservoir problem before the State Engineer, it would be of considerable importance and of vast assistance if there were available the results of evaporation experiments conducted on reservoirs in the State of Colorado. It is hoped that some of these experiments will be inaugurated on several reservoirs in this state in the near future. However, the conditions existing at this time must be met, and such records as are available must be used, digested and applied until such time as additional data is available.

There is available in the State Engineer's office a compilation of all of the evaporation data which it was possible to obtain from published records. In each instance the source of the compiled information has been given, so that it is possible for those interested to consult the original source of the information.

Table I has been compiled, using available evaporation records. In this table the location of the experiment and the source of information is given, and the monthly percentage of the total annual evaporation is entered under the column heading of the observation, and opposite the respective month. At the bottom of this table additional information is given, the method of conducting the experiment, the total annual depth of evaporation in inches, and the approximate altitude of the station where the observation was conducted. Table I contains data from fifty-two different stations scattered throughout the United States. This table was compiled for the purpose of obtaining a safe average monthly percentage of the total annual evaporation loss.

While it is realized that numerous experiments have been included in Table I which were conducted at localities and under conditions not in any manner comparable with those existing at the sites of most reservoirs in Colorado, yet it is believed that the method used in compiling this table is reasonable, and that a safe and usable monthly percentage can be obtained by combining the data given in this table. It is felt that the method used is more desirable than to obtain monthly percentages of loss from a few experiments conducted for shorter periods of time, even when such experiments or observations were made under local conditions which could be favorably compared with the particular reservoir under consideration. Each experiment, when considered by itself, with monthly percentages available, expresses relatively the variation which takes place in the rate of evaporation during the twelve month period. If the mean monthly percentage, obtained at the end of Table I is compared with the monthly percentages of each separate observation, it will be noted that in practically no case is there any considerable difference existing between the mean obtained and the particular monthly percentage of the individual experiment.

Total of Monthly per cent., 100.00.

Total of Means, 60.81.

Table II is a compilation of available evaporation data, which it is believed can be consistently compared with Colorado conditions existing at the sites of the reservoirs in this state. The Colorado Fuel and Iron Company Reservoir experiments were conducted by Mr. A. A. Weiland, and these reservoirs are located in the Arkansas Valley near Pueblo. The Queen Reservoir is located in the lower Arkansas Valley, and no detailed information is available as to the particular methods adopted for the conduct of these experiments. The Warren, Lee, Loomis and Clayborn Lake experiments were conducted by Prof. L. G. Carpenter, and all of these reservoirs are in the vicinity of Fort Collins. The Pathfinder experiments were conducted by the U. S. Reclamation Service. The broken records available have been completed by deducing the monthly loss in inches by applying the mean monthly percentage obtained from Table I. Table II gives a total mean annual evaporation loss of 60.31 inches, and, in view of the data available it is believed that this amount of gross evaporation loss is the best estimate which can be prepared at this time.

For all practical purposes it could be said that under average conditions a reservoir in the state of Colorado would lose a depth of sixty inches per annum; that of this sixty inches the depth lost in any particular month can be obtained by applying the percentages in Table I.

During these periods of the year when a stream-bed reservoir is not permitted to store, it is not entirely practicable and possible to administer this reservoir in such manner that its gage rod would be lowered a certain amount each week during the non-storage period? For example: If the annual evaporation loss is five feet per annum, during the month of July the gage rod of any stream-bed reservoir should be decreased 8.80 inches; and during any week of this month this gage rod would be lowered 2.2 inches, or at the rate of 0.284 inches per day.

It is believed that the direct right ditches on streams of this state should not be deprived of water to which they were entitled and had prior to the time of construction of a stream-bed reservoir, which reservoir now takes from the stream an amount of water sufficient to make up its evaporation losses.

This problem is becoming, and in some instances is already a vital one, and it is believed that the only equitable method of administering a stream-bed reservoir during the period of non-storage is to charge the reservoir in question its evaporation losses, and make weekly deductions from the gage rod to compensate for these losses.

CHAPTER VII

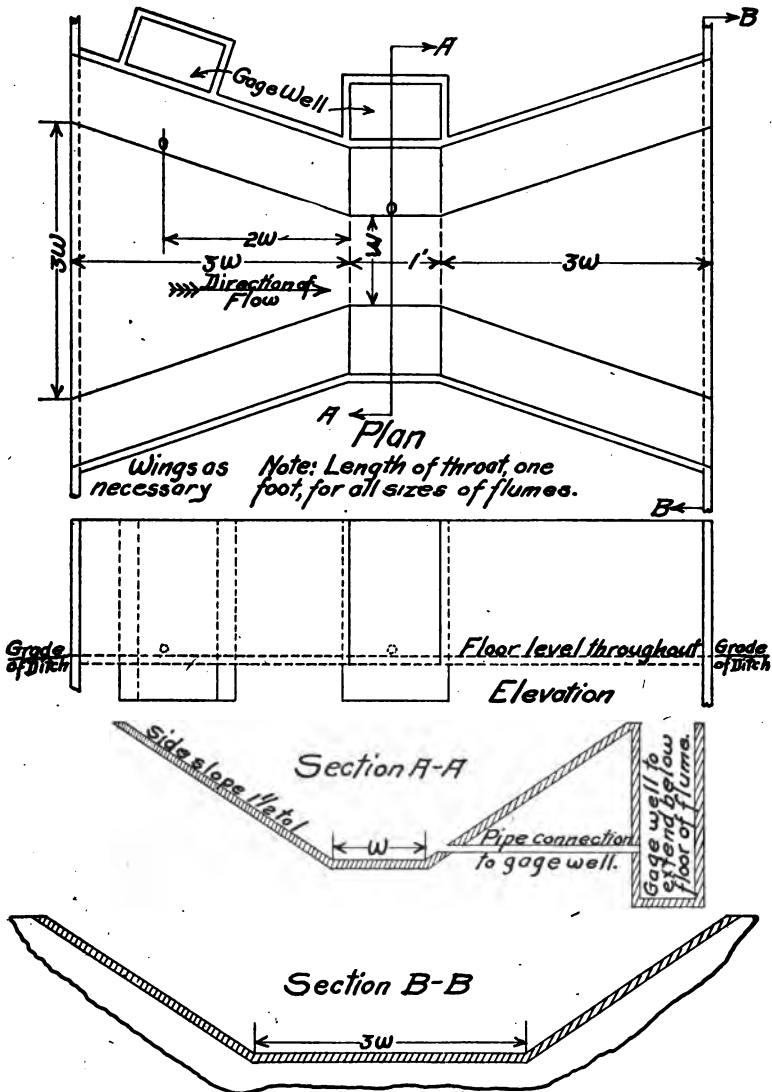

THE VENTURI FLUME

By V. M. Cone

Although there are many devices for the measurement of irrigation water, none of them meets all field conditions equally well. The ideal measuring device would be (1) inexpensive to construct, (2) simple to operate, (3) require little maintenance, (4) free from working parts, (5) accurate in its measurement, (6) free from sand, silt or floating trash troubles, and (7) require little loss of head in the ditch. It is almost too much to expect that any one device will successfully meet all these conditions, especially for both large and small ditches, but it is believed that the Venturi Flume is an advance step in the right direction. It is the purpose of this article to present some of the fundamental plans and results of preliminary experiments on this new type of device for measuring the flow in open channels, in order that those in practical need of such a device may know of its existence. Furthermore, it is hoped that the construction of sizes of Venturi Flumes larger than were tested in the laboratory will be encouraged thereby and they can be calibrated.

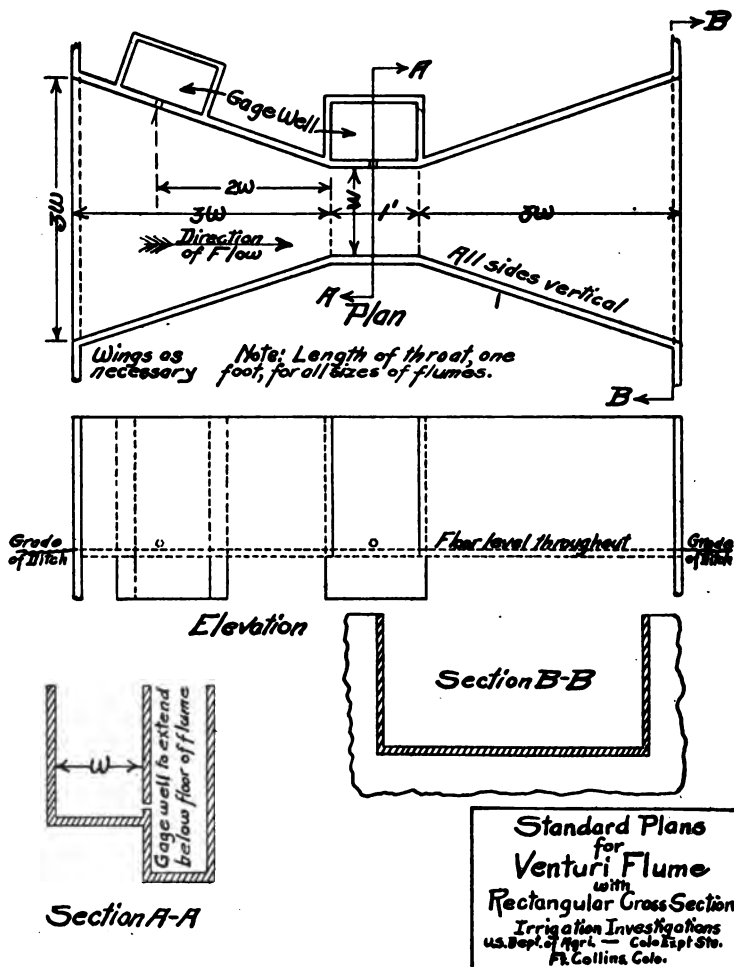

The Venturi Flume was developed in the hydraulic laboratory at Fort Collins, Colorado, during the season of 1915, under a co-operative agreement between the Colorado Experiment Station and the U. S. Department of Agriculture. As shown in the plans, Figures 1 and 2, it consists essentially of a flume with a converging and a diverging section and a short "throat" section between them. The floor is level and placed at the elevation of the bottom of the channel in which it is set. The standards shown in the plans were chosen after many experiments had been made, and were adopted as most nearly meeting practical requirements.

As the water flows through the flume there is a slight surface slope in the converging section, a rather sudden depression in the "throat" section, and a rise in the diverging section. The actual loss of head is small. The determination of the flow is obtained from readings of two gages, one of which has been placed in the middle of the throat section and the other has been arbitrarily located upstream from the start of the throat a distance equal to two-thirds the length of the converging section. The zero of these gages must be at the elevation of the floor of the flume, and it is especially important that the zero of the two gages be at exactly the same elevation. An error in placing the gages will make all discharge measurements in error, and it is especially serious in the difference in heads, H_a , which is a more important factor in determining the flow than the depths of water in the channel, H_a or H_b .

**Standard Plans for Venturi Flume
Trapezoidal Cross Section**

U.S. Dept. of Agri. — Irrigation Investigations — Colo. Expt. Sta.
Ft. Collins, Colo.

Still-boxes, or gage-wells, are necessary for accurate readings of the water level, and are recommended for general use. Field tests have shown that readings taken to the nearest one-hundredth of a foot on staff gages placed inside the flume at the proper locations, but with the face of the gages countersunk flush with the surface of the side of the flume, will give results close enough for general purposes, but additional tests in the laboratory have shown that such staff gage readings do not agree with the readings taken in the still-wells when there is enough fall in the ditch to make a comparatively high velocity of flow through the flume. Until more is known about this point, it will be safest to use still-wells.

Instrument makers are at work on an automatic register to give a continuous record of the two gage heights on a single sheet.

The effect of velocity of approach seems to be automatically taken care of in the Venturi Flume, and all field tests indicate that it will be free from changes in indicated discharge due to weed growth, accumulations of sand or silt in the ditch, or other changes in the ditch section. Such changes make the ordinary rating flume unreliable, but results only in changing the relative gage readings of the Venturi Flume without altering the rating of the device. The increased velocity of the water in the flume makes it self-cleaning of sand, silt and floating trash. It must be remembered, however, that the floor of the flume must not be placed below canal grade, which might allow sand and silt to accumulate especially at low velocities, and the standing water in the structure would alter the calibration. It is also important that the size of Venturi Flume be not considerably smaller than the size of the ditch, as this gives an opportunity for silt banks to form at the side of the entrance to the flume.

The Venturi Flume is not an exact measuring device, but it is accurate enough for most irrigation needs. Although only the smaller sizes have been experimented with, it is believed that larger sizes built according to the general plans will be applicable to use in main canals, and when properly constructed it does not require rating. It is simple to build of lumber or concrete, makes a good connection with concrete canal lining, does not obstruct the flow in the ditch, has a comparatively low cost, has no working parts, and is simple to operate.

The discharges through Venturi Flumes may be taken from curves as shown in figure 3, which is the flow through the rectangular Venturi Flume with a throat width of 1 foot. Curves have also been prepared to give the discharge through rectangular Venturi Flumes with throat widths of $1\frac{1}{2}$ and 2 feet, but lack of space prevents their being shown here. A special type called the V-Notch Venturi Flume has been devised to measure flows of from 0.1 second-foot to a maximum of 2 or 3 second-feet under practical ditch conditions, and another type having trapezoidal cross-section with side slopes of 1 to 1 and a bottom throat width of 0.5 foot will measure flows of less than 1 second-foot to a maximum of approximately 10 second-feet. The plans and discharge curves for these special types are not shown here.

A public patent has been applied for on the Venturi Flume to insure its use by any one who may want it without payment of royalties. Further experiments and calibrations of larger sizes will be undertaken in the near future and this information will be supplied to those interested upon application to Irrigation Investigations, Experiment Station, Fort Collins, Colorado.

CHAPTER VIII.

VERTICAL VELOCITY DETERMINATIONS.

During the irrigation season of 1915 this office made a number of velocity measurements in the various canal rating flumes in the Arkansas Valley to determine the relative accuracy of the three most commonly used methods of determining the mean velocity in a vertical; that is, the Vertical Integration, the Two Point or 0.2—0.8 depth method, and the One Point or 0.6 depth method. These measurements were made under a wide range of conditions, including minimum and maximum depths and velocities.

At the outset, it was assumed that the vertical velocity curve, for the purpose of this determination, gives the correct mean velocity in a vertical and the accuracy of the other three methods was measured by the vertical velocity curve. This curve was determined by making velocity measurements at six points in each vertical; that is, at the surface and bottom and at the 0.2, 0.4, 0.6 and 0.8 depths.

These measurements were made with a Price current meter, the surface measurement being taken at such depth that no ripples existed over the head of the meter. This depth, for the meter in question, is about 0.2 feet. The bottom measurement was taken as near the bottom as is possible with the Price meter and is about 0.1 foot from the floor.

It was found that out of the total of 54 curves, the six points, of 22 of this number, fell at such locations that it was impossible to pass a smooth curve through them without at some point inserting a reverse curve.

In using the Vertical Integration method, the meter was moved slowly from surface to bottom and back again, care being taken to move the meter uniformly throughout the operation.

All measurements were timed for at least 20 seconds.

At the conclusion of these field tests, a curve was plotted, as the mean of the 54 individual vertical velocity curves. This curve shows an error of 2.78 per cent for the Vertical Integration method, 3.69 per cent for the 0.2—0.8 method, and 5.84 per cent for the 0.6 method. The mean velocity as shown by this curve is found at 0.735 depth and the maximum velocity at 0.28 depth.

In addition to this eight curves were plotted, each one being a mean of individual curves taken under similar conditions. Following is a description of these curves and results obtained from them:

First. A mean of 8 curves, taken at depths of 1.5 feet or less, was plotted. This curve shows an error of 3.06 per cent for the 0.2—0.8 method, 6.25 per cent for the Vertical Integration method, and 6.5 per cent for the 0.6 method. The mean velocity was found to be at 0.76 depth and the maximum velocity at 0.37 depth.

Second. A mean of 9 curves, taken at depths of 3 feet and greater, was platted. This curve shows an error of 1.18 per cent for the Vertical Integration method, 3.36 per cent for the 0.2—0.8 method, and 5.43 per cent for the 0.6 method. The mean velocity was found to be at 0.68 depth, and the maximum velocity at 0.3 depth.

Third. A mean of 21 curves, whose mean velocity was $2\frac{1}{2}$ feet per second or less, was platted. This curve shows an error of 3.74 per cent for the Vertical Integration method, 4.57 per cent for the 0.6 method, and 5.74 per cent for the 0.2—0.8 method. The mean velocity was found to be at 0.69 depth, and the maximum velocity at 0.28.

Fourth. A mean of 15 curves, whose mean velocity was 3 feet per second or greater, was platted. This curve shows an error of 1.98 per cent for the Vertical Integration method, 3.67 per cent for the 0.2—0.8 method, and 5.84 per cent for the 0.6 method. The mean velocity was found to be at 0.695 depth, and the maximum velocity at 0.31 depth.

Fifth. A mean of 12 curves taken at a distance from the side of the flume, equal to or less than 25 per cent of the total width of the flume, was platted. This curve shows an error of 1.46 per cent for the Vertical Integration method, 3.55 per cent for the 0.2—0.8 method, and 7.95 per cent for the 0.6 method. The mean velocity was found to be at 0.735 depth, and the maximum velocity at 0.33 depth.

Sixth. A mean of 23 curves, taken near the center of the rating flume, was platted. This curve shows an error of 2.02 per cent for the Vertical Integration method, 4.23 per cent for the 0.2—0.8 method, and 4.55 per cent for the 0.6 method. The mean velocity was found to be 0.74 depth and the maximum velocity at 0.25 depth.

Seventh. A mean of 32 curves, in which no reverse curves were included, was platted. This curve shows an error of 2.65 per cent for the 0.2—0.8 method, 3.27 per cent for the Vertical Integration method, and 6.88 per cent for the 0.6 method. The mean velocity appears at 0.755 depth, and the maximum velocity at 0.28 depth.

Eighth. A mean of 22 reverse curves was platted. This curve shows an error of 2.15 per cent for the Vertical Integration method, 4.3 per cent for the 0.6 method, and 5.2 per cent for the 0.2—0.8 method. The mean velocity was found to be at 0.72 depth, and the maximum velocity at 0.27 depth.

In addition to the results shown by these curves, it was determined that for depths of 1.5 feet or greater, the Vertical Integration method is the most accurate.

On page 144 is given a tabulation which shows a comparison of the three methods, for each canal measured.

Columns 3 to 8, inclusive, show the comparative accuracy of these methods in per cents for each measurement made, arranged in the order of their accuracy.

Columns 9 to 11, inclusive, show the relative accuracy of the three methods in per cents for each canal measured, arranged in the order of their accuracy. The results in these columns were obtained by taking the mean of results indicated in the preceding columns.

By "Gross Mean Error," indicated at the bottom of the tabulation, is meant the arithmetical mean error, and by "Net Mean Error" is meant the algebraical mean error; that is, in the former, no consideration was given to the sign of the result.

Conclusions to be drawn from these tests are:

First. That in general, the Vertical Integration method is most accurate under all conditions, except when the depth is 1.5 foot or less, and that this accuracy increases with the depth. The exception is likely due to the fact that the 0.2 foot at the surface and the 0.1 foot at the floor, of slow water, through which it is impossible to move the meter, make up such a large per cent of the total depth, that this method must give way to the 0.2—0.8 method in point of accuracy.

Second. That under ideal conditions the 0.2—0.8 method is the most accurate, as shown by the seventh curve, wherein all reverse curves have been eliminated.

Third. That if a One Point measurement is to be used as the mean velocity in the vertical, it should be taken a little below the 0.7 depth.

Fourth. That the maximum velocity is found near the 0.3 depth.

Fifth. That the surface velocity is about 75 per cent of the mean velocity.

Sixth. That the tendency of all these methods is to show an exaggerated velocity, as the tabulation shows only 14 instances, out of a possible 147, in which the resulting velocity is less than the mean.

Hydrographic Department

During the biennial period this department has made 330 canal ratings and 900 stream measurements.

In addition to the above, some special investigations have been made on seepage and return water, and loss of water in transit from reservoirs.

To accomplish the work in an efficient and economic manner, hydrographers have been stationed in various districts throughout the state, viz.: Alamosa, Pueblo, Denver, and Steamboat Springs.

The district in the vicinity of Steamboat Springs has been covered by automobile instead of by team, as heretofore. An examination of this country will show that good roads cannot be expected to be general; however, a glance at the summary of the cost of operating an automobile in this section, as shown below, would indicate that the other districts could be covered in a more efficient and economical manner by the same means.

COST OF OPERATING FORD RUNABOUT IN HYDROGRAPHIC WORK, APRIL TO OCTOBER, 1916, INCLUSIVE

Gasoline (33c to 45c per gallon).....	\$ 95.68
Oil and grease	14.50
Tires	57.85
Equipment	18.25
Storage	30.80
Repairs	20.05
Miscellaneous supplies	9.75
<hr/>	
Total cost of operation.....	\$246.88
Total miles run	5,523
Cost per mile	0.045

Depreciation is not included in the above, and would increase the cost considerably, owing to the reduction in the cost of Ford cars since this one was purchased. The car, however, is in good condition, and valued at \$275.00.

There has been maintained during the biennial period about sixty permanent stream gaging stations. The number of stations should be increased, but unless more funds are allowed for traveling expenses and for gage readers' salaries, this cannot be done in a satisfactory manner.

The following pages contain estimates of daily discharge on the various gaging stations in the state.

The altitudes shown may be in error a few hundred feet—the altitude of the nearest town usually being given.

Later editions of maps have also made revision of drainage areas necessary at some stations.

Owing to lack of space in this report the actual discharge measurements have been omitted. These are on file in the State Engineer's office, and can be consulted at any time.

ARKANSAS DRAINAGE

TENNESSEE FORK NEAR LEADVILLE

Location.—At highway bridge in Sec. 16, T. 9 S., R. 80 W., a few hundred yards above the mouth of the stream and about three miles northwest of Leadville.

Records Available.—May 10 to October 31, 1890; June 18 to October 16, 1903; February 8, 1911, to November 11, 1916.

Drainage Area.—45 square miles.

Gage.—Vertical staff.

Channel.—Rough, put practically permanent.

Discharge Measurements.—Made from bridge during high water and by wading at ordinary stages.

Winter Flow.—Ice causes backwater during the winter months.

Diversions.—There are court decrees for diversions of 24 second-feet above the station. There is also a decree for diversion of 18.5 second-feet from the headwaters of Eagle River to Tennessee Fork above the station.

Co-operation.—Station maintained by the United States Geological Survey in co-operation with the United States Forest Service. Records were furnished by the United States Geological Survey.

EAST FORK OF ARKANSAS RIVER NEAR LEADVILLE

Location.—At highway bridge in Sec. 16, T. 9 S., R. 80 W., about 200 yards above mouth of Tennessee Fork, three miles northwest of Leadville.

Records Available.—April 25 to August 31, 1890; June 18 to September 29, 1903; June 5, 1911, to November 9, 1916.

Drainage Area.—52 square miles.

Gage.—Vertical staff.

Channel.—Somewhat shifting.

Discharge Measurements.—Made from bridge during high water and by wading at ordinary stages.

Winter Flow.—Ice causes backwater during the winter months.

Diversions.—There is a court decree for a diversion of 2 second-feet from the East Fork above the station by the Leadville Water Company.

Accuracy.—Results considered fair.

Co-operation.—Station maintained by the United States Geological Survey in co-operation with the United States Forest Service. Records furnished by the United States Geological Survey.

Discharge of East Fork Arkansas River near Leadville for 1915.

Unless otherwise noted, all discharges are in cubic feet per second.

ARKANSAS RIVER AT GRANITE.

Location.—At Granite, in sec. 31, T. 11 S., R. 79 W., below the mouth of Lake Creek and above Lost Canyon and Clear Creeks.

Records Available.—May 1, 1897, to September 10, 1899; April 6, 1910, to November 30, 1914.

Drainage Area.—425 square miles.

Gage.—Automatic recording gage established in 1910; datum of recording gage bears no determined relation to that of the vertical staff gage which was used from 1897 to 1899, and which was located at the highway bridge near the railroad station. During 1916 the automatic gage was out of order and estimates are based on readings of the staff gage.

Channel.—Practically permanent.

Discharge Measurements.—Made from car and cable.

Winter Flow.—Ice causes backwater during the winter months and the records are discontinued.

Artificial Control.—The discharge is affected by the operation of the Twin Lakes reservoir.

Diversions.—There are court decrees for diversions of 76 second-feet from the Arkansas between this station and the junction of Tennessee and East Forks, and diversions of 22 second-feet from the intervening tributaries.

Co-operation.—Station has been maintained in co-operation with the United States Geological Survey since 1913.

ARKANSAS RIVER AT SALIDA.

Location.—At Salida, Colorado, some distance above the mouth of the South Fork of Arkansas River, the nearest tributary of importance.

Records available.—April 11, 1895, to October 31, 1903; November 3, 1909, to December 31, 1916.

Drainage Area.—1,160 square miles.

Gage.—Automatic recording gage; no determined relation between automatic gage and the gage used from 1895 to 1903.

Channel.—Slightly shifting.

Winter Flow.—Springs keep the river open during the winter months.

Diversions.—There are court decrees for diversions of 199 second-feet from the Arkansas between this station and Granite, and diversions of 380 second-feet from intervening tributaries.

Co-operation.—This station has been maintained in co-operation with the U. S. Geological Survey.

Discharge of Arkansas River at Granite for 1915.
Drainage Area, 425 Square Miles. Altitude, 8,930 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

ARKANSAS RIVER AT CANON CITY.

Location.—Just below Hot Springs Hotel, at the mouth of the canyon, and $1\frac{1}{2}$ miles above Canon City. Nearest important tributary is Grape Creek, which enters above.

Records Available.—May 1, 1888, to November 30, 1916.

Drainage Area.—3,060 square miles.

Gage.—Automatic recording gage established by the State Engineer in September, 1909.

Channel.—The channel shifts to such an extent during high water that at times it is necessary to move the gage in order to read the gage heights.

Discharge Measurements.—Made from car and cable.

Winter Flow.—Ice causes backwater during the winter months.

Diversions.—There are court decrees for diversions of 131 second-feet from the Arkansas between the stations at Canon City and Salida, and diversions of 2,286 second-feet from intervening tributaries.

ARKANSAS RIVER AT PUEBLO.

Location.—At Main Street Bridge in Pueblo, 2 miles above the mouth of Fountain Creek, the nearest tributary.

Records Available.—September 19, 1894, to November 30, 1916. From May 1, 1885, to September 30, 1886, a station was maintained at Pueblo by the State Engineer; from June 1, 1887, to September 30, 1887, a station was maintained at a point 9 miles above Pueblo; from May 1, 1889, to August 31, 1889, the United States Geological Survey maintained the station 9 miles above Pueblo.

Drainage Area.—4,600 square miles.

Gage.—An automatic gage located 150 feet below Main Street Bridge has been used since March 22, 1911.

Channel.—Shifting.

Discharge Measurements.—Made from Main Street Bridge.

Winter Flow.—Ice causes some slight backwater during the winter months.

Diversions.—There are court decrees for diversions of 637 second-feet from Arkansas River, between the station at Canon City and Pueblo, and diversions of 372 second-feet from intervening tributaries.

Co-operation.—This station is maintained in co-operation with the Arkansas Valley Ditch Association.

Discharge of Arkansas River at Canon City for 1915.
Drainage Area, 3,060 Square Miles. Altitude, 5,363 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

ARKANSAS RIVER NEAR BOONE.

Location.—Located at the Rocky Ford High Line Canal dam near Boone.

Records Available.—July 1 to October 27, 1916. Station used only as a substitute for the station near Nepesta while a temporary brush dam was being used at that point.

Discharge Measurements.—Made from highway bridge above or by wading.

Diversions.—There are no diversions between this station and the one near Nepesta.

Accuracy.—Results are fair.

ARKANSAS RIVER NEAR NEPESTA.

Location.—At the dam of the Oxford Farmers' Canal Co., in sec. 31, T. 21 S., R. 60 W. $1\frac{1}{2}$ miles above Nepesta; about 6 miles below the mouth of Huerfano River, the nearest important tributary.

Records Available.—September 8, 1897, to October 31, 1903; July 14, 1909, to November 30, 1912; January 1, 1914, to November 30, 1916.

Drainage Area.—9,130 square miles.

Gage.—An automatic recording gage with its zero coinciding with the lowest point of the diversion dam has been in use since 1910. There is no known relation between the present gage and that used in 1903.

Channel.—The diversion dam is the control point, and as the results show shifting conditions it is evident that the dam is not permanent.

Discharge Measurements.—Made from the bridge at Nepesta except during low water, when measurements are made by wading.

Winter Flow.—Ice causes backwater during a portion of the winter months.

Diversions.—There are court decrees for diversions of 1,552 second-feet from the Arkansas between Pueblo and Nepesta, and approximately 1,600 second-feet from intervening tributaries. The discharge records given in this report do not include the flow of the canal.

Accuracy.—Results fair.

Co-operation.—Maintained in co-operation with the Arkansas Valley Ditch Association.

Discharge of Arkansas River near Boona for 1916.

ARKANSAS RIVER AT LA JUNTA.

Location.—Half a mile below the east bridge at La Junta; no important tributary within several miles.

Records Available.—April 11, 1912, to November 30, 1916. From December 5, 1893, to December 31, 1895, a station was maintained near the city pumping plant. During 1899 and 1901 a station was maintained at the head of the Fort Lyon Canal by the Great Plains Water Co. From April 7, 1903, to October 31, 1903, a station was maintained one mile east of La Junta and a number of discharge measurements were made during 1904. From August 27, 1908, to November 30, 1908, a station was maintained half a mile northwest of La Junta, just below the mouth of Crooked Arroyo.

Drainage Area.—12,200 square miles.

Gage.—Automatic recording gage.

Channel.—Shifting.

Discharge Measurements.—Made from the bridge during high water and by wading at ordinary stages.

Winter Flow.—Ice causes backwater during the winter months.

Diversions.—There are court decrees for diversions of 2,735 second-feet from the Arkansas between Nepesta and La Junta, and 511 second-feet from intervening tributaries.

Co-operation.—Station maintained in co-operation with the Arkansas Valley Ditch Association.

ARKANSAS RIVER AT LAMAR.

Location.—Located at highway bridge, one mile north of Lamar.

Records Available.—May 11, 1913, to November 30, 1916.

Gage.—Bristol automatic gage and standard chain gage.

Channel.—Shifting.

Diversions.—With the exception of a few small ditches, below all diversions on the river.

Accuracy.—Results are considered fair.

Co-operation.—Maintained in co-operation with the Arkansas Valley Ditch Association.

Discharge of Arkansas River at La Junta for 1915.

Drainage Area, 12,200 Square Miles. Altitude, 4,052 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.
Discharge estimated Jan. 6—Feb. 21, acc't ice.

ARKANSAS RIVER AT HOLLY.

Location.—At highway bridge half a mile southeast of Holly, on line between secs. 14 and 15, T. 23 S., R. 42 W., 1 mile below the mouth of Wild Horse Creek, an intermittent stream.

Records Available.—October 15, 1907, to November 30, 1916.

Drainage Area.—Approximately 25,000 square miles.

Gage.—A number of gages have been used at the station, but all readings have been referred to the same datum except those from October 25 to December 31, 1911, when a different datum was used.

Channel.—Very shifting.

Discharge Measurements.—Made from bridge during high water and by wading at low stages.

Winter Flow.—Ice causes backwater during a portion of the winter months.

Diversions.—There are court decrees for diversions of 1,072 second-feet from Arkansas River between the stations at La Junta and Holly, and diversions of 1,253 second-feet from intervening tributaries. There are many diversions from Arkansas River below Holly, in Kansas.

Co-operation.—Station maintained in co-operation with the Arkansas Valley Ditch Association.

COTTONWOOD CREEK BELOW HOT SPRINGS, NEAR BUENA VISTA.

Location.—In the Leadville National Forest, at bridge in sec. 22, T. 14 S., R. 79 W., half a mile below Hot Springs Hotel and 6 miles west of Buena Vista; 2 miles below mouth of South Fork, the nearest tributary.

Records Available.—April 7, 1911, to December 31, 1916. From September 23, 1910, to September 13, 1911, a station was maintained in section 21, 1 mile above the present station.

Drainage Area.—72 square miles.

Gage.—Vertical staff.

Channel.—Practically permanent.

Discharge Measurements.—Made from bridge or by wading.

Winter Flow.—The river is open during the winter months on account of hot springs above.

Diversions.—There are court decrees for diversions of 148 second-feet from Cottonwood Creek, of which 28 second-feet are above the station.

Accuracy.—Records good.

Co-operation.—Station maintained by the United States Geological Survey in co-operation with the United States Forest Service. Records furnished by the United States Geological Survey.

Discharge of Arkansas River at Holly for 1915.
Drainage Area, 25,000 Square Miles. Altitude, 3,387 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

CHALK CREEK AT UPPER STATION NEAR ST. ELMO.

Location.—In sec. 27, T. 15 S., R. 80 W., in the Leadville National Forest, one-quarter mile below the power plant of the Tin Cup Gold Dredging Company, and one and one-quarter miles below St. Elmo. The nearest tributary is Coal Creek, which enters a quarter mile below.

Records Available.—November 15, 1913, to November 12, 1916.

Drainage Area.—48 square miles (measured from Forest atlas).

Gage.—Friez recording gage owned by the Tin Cup Gold Dredging Company.

Channel.—Apparently permanent.

Discharge Measurements.—Made from foot bridge and by wading.

Winter Flow.—Affected very little by ice.

Diversions.—There are no court decrees for diversions from Chalk Creek, the water of which is not returned to the stream above the station.

Regulated Flow.—Low-water flow regulated to a certain extent by a small reservoir at St. Elmo formed by the diversion dam for the Tin Cup Gold Dredging power house.

Accuracy.—Conditions are favorable for accurate results and the estimates are considered excellent.

Co-operation.—Records furnished by the United States Geological Survey.

CHALK CREEK NEAR ST. ELMO.

(Lower Station.)

Location.—In the Leadville National Forest at highway bridge in sec. 28, T. 15 S., R. 79 W., just below the cascades of Chalk Creek and 6 miles east of St. Elmo. Nearest tributary is a small intermittent stream entering from the north just below.

Records Available.—March 10, 1911, to March 31, 1916. From September 6 to December 28, 1910, a station was maintained in sec. 24, T. 15 S., R. 79 W. Station discontinued March 31, 1916.

Drainage Area.—75 square miles.

Gage.—Vertical staff.

Channel.—Somewhat shifting.

Discharge Measurements.—Made from the bridge during high water and by wading at ordinary stages.

Winter Flow.—Ice causes only slight backwater.

Diversions.—There are no court decrees for diversions from Chalk Creek above the station, but below there are decrees for 132 second-feet.

Accuracy.—Results fair.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of Chalk Creek at Upper Station near St. Elmo for 1915.
Drainage Area, 48 Square Miles. Altitude, 10,000 Feet Above Sea Level.

SOUTH FORK OF ARKANSAS RIVER AT PONCHA.

Location.—At highway bridge about half a mile from Poncha, in sec. 10, T. 49 N., R. 8 E. Nearest tributary, Poncha Creek, enters one-fourth mile below.

Records Available.—January 14, 1911, to November 9, 1916.

Drainage Area.—140 square miles.

Gage.—Vertical staff.

Channel.—Slightly shifting.

Discharge Measurements.—Made from bridge during high water and by wading at ordinary stages.

Winter Flow.—Springs keep this stream open during the winter months.

Diversions.—There are court decrees for diversions of 114 second-feet from the South Fork above the station, and 77 second-feet below. There are also decrees for diversions of 85 second-feet from the North Fork which enters above.

Accuracy.—Results good.

Co-operation.—Records furnished by the United States Geological Survey.

PONCHA CREEK AT PONCHA.

Location.—At highway bridge in sec. 10, T. 49 N., R. 8 E., near Poncha, about one-fourth mile above the mouth of creek.

Records Available.—January 14, 1911, to December 31, 1916.

Drainage Area.—89 square miles.

Gage.—Vertical staff.

Channel.—Slightly shifting.

Discharge Measurements.—Made from bridge during high water and by wading at ordinary stages.

Winter Flow.—Springs prevent the creek from freezing to any considerable extent.

Diversions.—There are court decrees for diversions of 7 second-feet above the station, but none below.

Accuracy.—Results good.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of South Fork Arkansas River at Poncha for 1915.
Drainage Area, 140 Square Miles. Altitude, 7,471 Feet Above Sea Level.

PURGATOIRE RIVER AT TRINIDAD.

Location.—About 200 feet above the Commercial Street bridge at Trinidad.

Records Available.—April 1, 1916, to November 11, 1916. From 1897 to 1899 and 1905 to 1912 a station was maintained about 1,000 feet above the present location.

Drainage Area.—742 square miles.

Channel.—Shifting.

Gage.—Painted on sloping concrete facing on north bank of river.

Discharge Measurements.—Made by wading at low stages and from Animas Street bridge during high water.

Winter Flow.—Observations discontinued during the winter months.

Diversions.—There are decrees for diversions of 186 second-feet from the Purgatoire River above this station.

Accuracy.—Results for 1916 cannot be considered better than fair.

Discharge of Purgatoire River at Trinidad for 1916.
Drainage Area, 742 Square Miles. Altitude, 5,990 Feet Above Sea Level.

GRAND DRAINAGE.

NORTH FORK OF GRAND RIVER NEAR GRAND LAKE.

Location.—Three miles southwest of Grand Lake, in sec. 13, T. 3 N., R. 76 W. Nearest tributary, Grand Lake outlet, enters some distance below; no tributaries for several miles above the station.

Records Available.—July 29, 1904, to September 30, 1909; September 20, 1910, to December 31, 1916.

Gage.—Vertical staff.

Drainage Area.—107 square miles.

Channel.—Practically permanent.

Discharge Measurements.—Made from highway bridge at the gage.

Winter Flow.—Ice forms along the edges, but springs keep the river open.

Diversions and Storage.—There are court decrees for diversions of 699 second-feet from the headwaters above the station. Of this amount 525 second-feet are for diversion across the divide into the headwaters of the Cache la Poudre. There is also a reservoir decree for 19,000 acre-feet from the flood water.

Accuracy.—Results considered good.

Co-operation.—Station maintained in co-operation with the United States Geological Survey.

GRAND RIVER AT SULPHUR SPRINGS.

Location.—At the bridge connecting the Denver, Northwestern & Pacific Railway station with the town of Sulphur Springs, in sec. 2, T. 1 N., R. 78 W. Nearest tributary, Beaver Creek, enters the river 2 miles below the station.

Records Available.—July 22, 1904, to September 30, 1909, a station was maintained at this point by the United States Geological Survey; September 23, 1910, to November 11, 1916.

Drainage Area.—946 square miles.

Gage.—Chain gage.

Channel.—Somewhat shifting.

Discharge Measurements.—Made from bridge during high and ordinary stages and by wading during low water.

Winter Flow.—The river is frozen over during the winter months and discharge measurements are made to determine the winter flow.

Diversions.—Between this station and the mouth of North Fork there are court decrees for diversions of 96 second-feet from Grand River, and there is also a reservoir decree for 31,300 acre-feet from the flood waters of Grand River.

Accuracy.—Results considered good.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of North Fork of Grand River near Grand Lake for 1915.
Drainage Area, 107 Square Miles. Altitude, 8,153 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

GRAND RIVER NEAR KREMMLING.

Location.—At the entrance to Gore Canyon, 3 miles southwest of Kremmling, in sec. 23, T 1 N., R. 81 W. Nearest tributary, Blue River, enters a mile below Kremmling.

Records Available.—July 24, 1904, to November 30, 1916.

Drainage Area.—2,380 square miles.

Gage.—Automatic recording gage.

Channel.—Somewhat shifting.

Winter Flow.—Rapids below the station remain open and thus prevent backwater except for short periods when ice jams on the rapids.

Diversions.—Between this station and that at Sulphur Springs there are court decrees for diversions of 34 second-feet from Grand River and 2,315 second-feet from intervening tributaries exclusive of diversions for placer mining in the Blue River drainage.

Accuracy.—Although the channel is somewhat shifting, sufficient discharge measurements have been made to form a basis for fairly reliable estimates of flow.

Co-operation.—Station maintained in co-operation with the United States Geological Survey.

GRAND RIVER AT GLENWOOD SPRINGS.

Location.—At Glenwood Springs, at the point where the discharge from the hot springs enters the river. No Name Creek enters Grand River about 2 miles above the station and Roaring Fork enters one-half mile below.

Records Available.—May 12, 1899, to December 31, 1916.

Drainage Area.—4,520 square miles.

Gage.—Chain gage originally installed at the railroad bridge just above the Roaring Fork, but in 1900 a staff gage was installed at the present location. Since 1902 a number of automatic gages referred to the staff gage datum have been used, the present one being a Friez gage.

Channel.—Slightly shifting.

Discharge Measurements.—Made from a car and cable stretched beneath the State Street Bridge, which crosses the river one-third mile below the gage.

Winter Flow.—Ice never forms at the station, as the hot water from the springs keeps the water above the freezing point.

Artificial Control.—The Shoshone power plant of the Central Colorado Power Company, 6 miles above Glenwood Springs, has sufficient pondage to withhold the flow of the river for a portion of the day during low-water periods.

Diversions.—Between this station and the one near Kremmling there are court decrees for a diversion of 13 second-feet from Grand River for irrigation, 1,250 second-feet absolute for power and 14,400 second-feet conditional for power.

Accuracy.—Conditions are favorable for accurate results and the estimates are considered reliable.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of Grand River near Kremmling for 1915.
Drainage Area, 2,380 Square Miles. Altitude, 7,320 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

GRAND RIVER NEAR PALISADES.

Location.—At the State bridge 2 miles above Palisades, in sec. 2, T. 11 S., R. 98 W. Nearest important tributary, Plateau Creek, enters about 6 miles above the station.

Records Available.—April 9, 1902, to November 30, 1916.

Drainage Area.—8,550 square miles.

Gage.—Chain gage; location and datum unchanged.

Channel.—Practically permanent.

Discharge Measurements.—Made from bridge in Palisades.

Winter Flow.—The river usually freezes over a portion of the year, but except for slush and ice and an occasional thin ice cover the effect on the gage heights is slight.

Diversions.—There are court decrees for diversions of 1,828 second-feet from Grand River and 2,500 second-feet from intervening tributaries between Palisades and the Glenwood Springs station. The proposed high line canal of the United States Reclamation Service will divert 700 second-feet 7 miles above the Palisades station. Below the station the Grand Valley Irrigation Co. has a diversion of 400 second-feet.

Accuracy.—Conditions are favorable for accurate results, and the estimates should be reliable.

Co-operation.—Records furnished by the United States Geological Survey.

GRAND RIVER NEAR FRUITA.

Location.—At highway bridge, $1\frac{1}{2}$ miles south of Fruita, in sec. 20, T. 1 N., R. 2 W., Ute principal meridian. Nearest important tributary, Little Salt Wash, enters a mile below the station; Gunnison River enters at Grand Junction, about 12 miles above.

Records Available.—Flood records during 1908, 1909, and 1910; April 1, 1911 (station established), to December 9, 1916.

Drainage Area.—16,800 square miles.

Gage.—Chain gage; datum was raised 0.05 foot May 3, 1911.

Channel.—Shifts at high water.

Discharge Measurements.—Made from the highway bridge.

Winter Flow.—The river is frozen over during a portion of the year and readings are discontinued.

Diversions.—Between the Palisades station and Fruita there are decrees for 788 second-feet from the Grand River.

Maximum Stage.—Since the establishment of the station the maximum stage has been 15.0 feet, which occurred June 9, 1909. The highest stage known was about 18.5 feet on July 4, 1884.

Accuracy.—Results considered good.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of Grand River near Palisades for 1915.
Drainage Area, 8,550 Square Miles. Altitude, 4,730 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

First 18 days February estimated 2,720.

FRASER RIVER NEAR ARROW.

Location.—In sec. 4, T. 2 S., R. 75 W., $\frac{1}{4}$ mile from Vasquez Siding; $1\frac{1}{2}$ miles southwest of Arrow.

Records Available.—September 23, 1910, to November 11, 1916.

Drainage Area.—28 square miles.

Gage.—Friez automatic gage on left bank. Prior to June 3, 1916, vertical staff gage located one mile upstream.

Discharge Measurements.—Made from log bridge and by wading.

Channel.—Probably permanent.

Diversions.—There is a court decree for the diversion of 53 second-feet from the headwaters of this stream across the divide to the Clear Creek basin.

Accuracy.—Records are considered good.

Co-operation.—Station maintained by the United States Geological Survey, by whom the records are furnished.

WILLIAMS FORK NEAR SCHOLL.

Location.—About 5 miles southeast of Scholl, Colo., in sec. 3, T. 2 S., R. 78 W., at the Horseshoe ranger station in the Arapahoe National Forest. Nearest important tributary, Keyser Creek, enters from the east three-quarter mile above the station.

Records Available.—September 22, 1910, to June 30, 1912; April 27, 1913, to November 30, 1916.

Drainage Area.—141 square miles.

Gage.—Vertical staff.

Channel.—Rough but practically permanent.

Discharge Measurements.—Made from car and cable 400 ft. above gage.

Winter Flow.—Ice causes very little backwater during the winter months.

Diversions.—There are court decrees for the diversion of 858 second-feet from Williams Fork above the station. Of this amount 700 second-feet are to be diverted to the eastern slope. This latter diversion has not yet been made.

Accuracy.—Results are considered good.

Co-operation.—Station maintained by the United States Geological Survey, by whom the records were furnished.

Discharge of Fraser River near Arrow for 1915.
Drainage Area, 28 Square Miles. Altitude, 9,500 Feet Above Set Level.

WILLIAMS FORK NEAR PARSHALL.*

Location.—On highway bridge at Field's ranch, 4 miles above the mouth of the river, about sec. 36, T. 1 N., R. 79 W. Nearest tributary is Battle Creek, which enters from the west 2 miles below the station.

Records Available.—July 25, 1904, to November 15, 1916.

Drainage Area.—185 square miles.

Gage.—Vertical staff; location and datum unchanged.

Channel.—Shifting after high water.

Discharge Measurements.—Made from bridge to which the gage is attached.

Winter Flow.—The main channel is kept open by springs, but ice forms along the edges and slush ice frequently forms. The morning readings are usually affected by backwater from ice, but the afternoon readings are practically unaffected.

Diversions.—There are court decrees for the diversion of 558 second-feet from Williams Fork between this station and the one near Scholl, and 25 second-feet from tributaries. There is also a storage decree for 80,700 and 1,420 acre-feet from Williams Fork.

Accuracy.—Conditions are favorable for accurate results, and the estimates should be reliable.

Co-operation.—Station maintained in co-operation with the United States Geological Survey.

*Formerly designated Williams Fork near Sulphur Springs.

BLUE RIVER AT DILLON.

Location.—At the cemetery bridge on the outskirts of Dillon, in sec. 18, T. 5 S., R. 77 W., on the edge of the Leadville National Forest, a short distance above the mouth of Snake River. Ten-Mile Creek also enters below the station.

Records Available.—October 15, 1910, to November 13, 1916.

Drainage Area.—110 square miles.

Gage.—Vertical staff; location and datum unchanged.

Channel.—Practically permanent.

Discharge Measurements.—Made by wading near by and from bridge.

Winter Flow.—Ice causes backwater during the winter and discharge measurements are made to determine the flow.

Diversions.—There are court decrees for diversions of 2.3 second-feet from Blue River above the station and 63 second-feet below, exclusive of a decree for 350 second-feet for the Green Mountain Canal. There is an adjudicated diversion from the headwaters of the Blue across Boreas Pass to Tarryall Creek. There are also decrees for diversions of 5 second-feet from tributaries entering above. In addition, there are decrees for placer mining, where practically all of the water used is returned to the river.

Accuracy.—Records considered reliable.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of Williams Fork near Parshall for 1915.
Drainage Area, 185 Square Miles. Altitude, 7,800 Feet Above Sea Level.

SNAKE RIVER AT DILLON.

Location.—At a highway bridge 200 yards above the mouth of the river in sec. 18, T. 5 S., R. 77 W. Nearest tributary is a small stream that enters from the north 1 mile above station.

Records Available.—October 15, 1910, to November 6, 1916.

Drainage Area.—92 square miles.

Gage.—Vertical staff; location and datum unchanged.

Channel.—Practically permanent.

Discharge Measurements.—Made from the bridge and by wading.

Winter Flow.—Ice gorging causes backwater of varying amount.

Diversions.—There are court decrees for diversions of 4.5 second-feet from Snake River above the station and 11 second-feet from tributaries entering above. The Summit County Power Company diverts about 30 second-feet around the station.

Accuracy.—Records reliable.

Co-operation.—Records furnished by the United States Geological Survey.

TEN-MILE CREEK AT DILLON.

Location.—At the highway bridge in Dillon, in sec. 18, T. 5 S., R. 77 W., 300 yards above the mouth of the creek. Nearest tributary, Canon Creek, enters from the west about 4 miles above the station.

Records Available.—October 15, 1910, to November 7, 1916.

Drainage Area.—113 square miles.

Gage.—Vertical staff; location and datum unchanged.

Channel.—Practically permanent.

Discharge Measurements.—Made by wading and from bridge.

Winter Flow.—Ice causes backwater during the winter months, and discharge measurements are made to determine the flow during that period.

Diversions.—There are court decrees for diversions of 11 second-feet from Ten-Mile Creek above the station and 14.5 second-feet from tributaries entering above.

Accuracy.—Records considered reliable.

Co-operation.—Records furnished by the United States Geological Survey.

Unless otherwise noted, all discharges are in cubic feet per second.

EAGLE RIVER AT RED CLIFF.

Location.—In sec. 29, T. 6 S., R. 80 W., in the town of Red Cliff, in the Holy Cross National Forest, 100 yards above mouth of Turkey Creek, and 1 mile above the mouth of Homestake Creek.

Records Available.—January 8, 1911, to November 2, 1916.

Drainage Area.—74 square miles.

Gage.—Chain gage; location and datum unchanged.

Channel.—Slightly shifting.

Discharge Measurements.—Made from highway bridge at 800 feet above during high water and by wading at ordinary stages.

Winter Flow.—Little, if any, ice forms at this station.

Diversions.—There are court decrees for diversions of 22 second-feet from Eagle River and tributaries above the station; 18.5 second-feet of this amount for diversion to the Arkansas Basin.

Accuracy.—Records considered good.

Co-operation.—Records furnished by the United States Geological Survey.

EAGLE RIVER AT EAGLE.

Location.—At the highway bridge at Eagle, in Eagle County, three-fourths of a mile above the mouth of Brush Creek.

Records Available.—March 12, 1905, to February 10, 1907, at site a short distance below the mouth of Brush Creek; January 17, 1911, to November 13, 1916, at present site.

Drainage Area.—630 square miles.

Gage.—Chain gage.

Channel.—Practically permanent.

Discharge Measurements.—Made from highway bridge at ordinary and high stages and by wading during low water.

Winter Flow.—Ice causes backwater during the winter. Discharge measurements are made to determine the winter flow.

Diversions.—Between Eagle and the station at Red Cliff there are court decrees for diversions of 380 second-feet from Eagle River, of which 300 second-feet is for power, and for diversions of 286 second-feet from intervening tributaries. Between Eagle and the mouth there are decrees for 22 second-feet from Eagle River.

Accuracy.—Records considered good.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of Eagle River at Red Cliff for 1915.
Drainage Area, 74 Square Miles. Altitude, 8,598 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

HOMESTAKE CREEK NEAR RED CLIFF.

Location.—In sec. 30, T. 6 S., R. 80 W., one-fourth mile above the mouth of the creek and three-fourths of a mile from Red Cliff; below all tributaries.

Records Available.—January 8, 1911, to December 20, 1916.

Drainage Area.—64 square miles.

Gage.—Vertical staff.

Channel.—Apparently permanent.

Discharge Measurements.—Made by wading near by.

Winter Flow.—Ice causes backwater, and discharge measurements are made to determine the winter flow.

Diversions.—There are court decrees for diversions of 1.2 second-feet from Homestake Creek.

Accuracy.—Records considered good.

Co-operation.—Records furnished by the United States Geological Survey.

TURKEY CREEK AT RED CLIFF.

Location.—At highway bridge in Red Cliff, 800 feet above the mouth of the creek.

Records Available.—June 30, 1913, to October 11, 1916.

Drainage Area.—27 square miles.

Gage.—Vertical staff.

Discharge Measurements.—Made from single span bridge, and by wading.

Winter Flow.—Ice causes backwater during the winter months, and discharge measurements are made to determine the flow.

Accuracy.—Records considered good.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of Homestake Creek near Red Cliff for 1915.
Drainage Area, 64 Square Miles. Altitude, 8,598 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

ROARING FORK AT ASPEN.

Location.—At the bridge near the old power plant at Aspen, above Castle, Maroon and Hunter Creeks.

Records Available.—January 1, 1911, to December 31, 1916.

Drainage Area.—109 square miles.

Gage.—Vertical staff.

Channel.—Practically permanent.

Discharge Measurements.—Made by wading, except during high water, when bridge is used.

Winter Flow.—Ice causes backwater during the winter; discharge measurements are made to determine the winter flow.

Diversions.—The Salvation ditch, which has a decree for 58 second-feet, diverts water above the station usually from the middle of May to the middle of September.

Accuracy.—Results are reliable.

Co-operation.—Records furnished by the United States Geological Survey.

ROARING FORK BELOW ASPEN.

Location.—In sec. 1, T. 10 S., R. 85 W., two miles below Aspen at the first highway bridge. Nearest tributary above is Castle Creek, and below, Maroon Creek.

Records Available.—October 18, 1913, to December 28, 1916.

Drainage Area.—223 square miles.

Gage.—Vertical staff.

Control.—Shifts slightly at high water.

Discharge Measurements.—Made from two-span bridge.

Winter Flow.—Ice causes little or no backwater during the winter months, as shown by discharge measurements.

Diversions.—Between the station at Aspen and this one there are a number of small diversions, some of which return the water to the river above this station. The Roaring Fork Light and Power Company diverts water from Maroon Creek into Castle Creek, and thence into Roaring Fork above the station.

Accuracy.—Results considered reliable.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of Roaring Fork at Aspen for 1915.
Drainage Area, 109 Square Miles. Altitude, 7,931 Feet Above Sea Level.

ROARING FORK AT GLENWOOD SPRINGS.

Location.—On bridge 500 feet above the mouth of the river in Glenwood Springs. Nearest important tributary enters about 3 miles above the station.

Records Available.—April 6, 1906, to September 30, 1909; September 21, 1910, to December 31, 1916.

Drainage Area.—1,450 square miles.

Gage.—November 20, 1915, a new slope gage established 800 feet above bridge.

Channel.—Practically permanent, but rough. Extremely high water in Grand River may cause backwater at the gage. Measurements made at stages as high as 5.7 feet on Roaring Fork, and 9.2 feet on Grand River have shown no backwater effect.

Discharge Measurements.—Made from highway bridge.

Winter Flow.—Surface ice rarely forms entirely across the river, but slush and anchor ice frequently occur. Discharge measurements sometimes show backwater from ice.

Diversions.—There are court decrees for diversions of 196 second-feet from Roaring Fork above the station, and 795 second-feet from the various tributaries.

Accuracy.—Conditions are favorable for accurate results; estimates should be reliable.

Co-operation.—Records furnished by the United States Geological Survey.

CASTLE CREEK NEAR ASPEN.

Location.—In sec. 35, T. 10 S., R. 85 W., in the Sopris National Forest, on the highway bridge 4 miles above Aspen. No tributary between the station and the mouth of the creek except small gulches that carry spring run-off. Nearest tributary above, Conundrum Creek, enters one mile upstream.

Records Available.—February 16, 1911, to December 8, 1916.

Drainage Area.—72 square miles.

Gage.—Automatic gage.

Channel.—Slightly shifting.

Discharge Measurements.—Made from car and cable during high water and by wading at low stages.

Winter Flow.—Affected by ice and discharge measurements are made to determine the flow.

Diversions.—No water is diverted above the station. The Roaring Fork Light & Power Co. and the Newman mine divert water from Castle Creek below the station.

Accuracy.—Results considered excellent except for latter part of 1916.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of Boaring Fork at Glenwood Springs for 1915.
Drainage Area, 1,450 Square Miles. Altitude 5,747 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

MAROON CREEK NEAR ASPEN.

Location.—In sec. 22, T. 10 S., R. 85 W., in the Sopris National Forest, just above the headgate of the Roaring Fork Light & Power Co., 5 miles above Aspen, Colo. Nearest tributary, Willow Creek, enters just below the station.

Records Available.—January 1, 1911, to September 30, 1916.

Drainage Area.—42 square miles.

Gage.—Vertical staff.

Channel.—Practically permanent.

Discharge Measurements.—Made by wading, except during high water, when they are made from a footbridge.

Winter Flow.—Discharge measurements indicate that ice does not cause backwater at this station.

Diversions.—One or two small diversions above the station; the Roaring Fork Light & Power Co. diverts water just below.

Accuracy.—Estimates made are reliable.

Co-operation.—Records furnished by the United States Geological Survey.

MAROON CREEK NEAR ASPEN (LOWER STATION).

Location.—In sec. 15, T. 10 S., R. 85 W., at highway bridge, 2½ miles southwest of Aspen.

Records Available.—February 13, 1914, to November 30, 1915.

Drainage Area.—54 square miles.

Gage.—Vertical staff.

Discharge Measurements.—Made from single span bridge during high water and by wading at low stages.

Channel.—Slightly shifting.

Winter Flow.—Discharge not seriously affected by ice.

Discharge of Maroon Creek near Aspen for 1915.
Drainage Area, 42 Square Miles. Altitude, 8,300 Feet Above Sea Level.

NORTH FORK OF FRYING PAN CREEK NEAR NORRIE.

Location.—On a highway bridge in sec. 21, T. 8 S., R. 83 W., in the Sopris National Forest, about 1 mile from Norrie. No tributaries between the station and the mouth of the creek.

Records Available.—February 18, 1911, to November 9, 1916.

Drainage Area.—42 square miles.

Gage.—Vertical staff.

Channel.—Practically permanent, but rough.

Discharge Measurements.—Made from the bridge during high water and by wading at ordinary stages.

Winter Flow.—Affected by ice.

Diversions.—No water is diverted above the station, so the records represent the natural run-off.

Accuracy.—Owing to the scattering gage heights and the probable error in mean daily stage as determined from one reading, the estimates cannot be considered better than fair.

Co-operation.—Station maintained by the United States Geological Survey in co-operation with the United States Forest Service. Records furnished by the United States Geological Survey.

FRYING PAN CREEK AT NORRIE.

Location.—At the highway bridge in Norrie, in sec. 28, T. 8 S., R. 83 W., in the Sopris National Forest, 1 mile above the entrance of the North Fork.

Records Available.—February 18, 1911, to November 12, 1916.

Drainage Area.—92 square miles.

Gage.—Vertical staff.

Channel.—Slightly shifting after high water.

Discharge Measurements.—Made from the bridge.

Winter Flow.—Ice probably causes backwater during the winter months.

Diversions.—No water is diverted from this creek either above or below the station.

Accuracy.—Records reliable.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of North Fork Frying Pan Creek near Norris for 1915.
Drainage Area, 42 Square Miles. Altitude, 8,431 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

FRYING PAN CREEK AT THOMASVILLE.

Location.—At a private bridge in sec. 7, T. 8 S., R. 83 W., 1,000 feet S. W. of railroad station. Nearest tributary, Deadman Gulch, enters $\frac{1}{4}$ mile below.

Records Available.—January 2, 1911, to November 30, 1916.

Drainage Area.—175 square miles.

Gage.—Vertical staff.

Channel.—Practically permanent, but rough.

Discharge Measurements.—Made from the bridge during high water and by wading at ordinary stages.

Winter Flow.—Ice causes backwater during the winter months, and discharge measurements are made to determine the flow.

Diversions.—As there are no court decrees for diversion of water above the station, it is probable that the records represent the natural run-off from the drainage basin.

Accuracy.—Conditions favorable for fairly accurate determination of discharge; results should be reliable.

Co-operation.—Records furnished by the United States Geological Survey.

CRYSTAL RIVER AT MARBLE.

Location.—Near the electric railway bridge of the Colorado Yule Marble Co., in sec. 26, T. 11 S., R. 88 W., at Marble. Nearest tributary, Carbonate Creek, enters above Marble.

Records Available.—November 1, 1910, to November 30, 1915.

Drainage Area.—77 square miles.

Gage.—A vertical hook gage graduated to hundredths of a foot.

Channel.—Shifts slightly at long intervals.

Discharge Measurements.—Measurements made from car and cable and by wading.

Winter Flow.—Gage heights at this station little, if any, affected by ice.

Diversions.—There are no court decrees for diversions above the station, but for 114 second-feet below Marble.

Accuracy.—Conditions are favorable for fairly accurate results and the estimates are considered reliable.

Co-operation.—The field data are furnished through the courtesy of the Colorado-Yule Marble Co. to the United States Geological Survey, from whom records were obtained.

Discharge of Frying Pan Creek at Thomasville for 1915.
Drainage Area, 175 Square Miles. Altitude, 7,968 Feet Above Sea Level.

EAST ELK CREEK NEAR NEW CASTLE.

Location.—At the highway bridge on line between secs. 24 and 25, T. 5 S., R. 91 W., $2\frac{1}{2}$ miles northwest of New Castle, Colo. No tributaries between the station and the mouth.

Records Available.—January 19, 1911, to July 12, 1915.

Drainage Area.—60 square miles.

Gage.—Vertical staff.

Channel.—Permanent prior to high water of 1912, when it shifted.

Discharge Measurements.—Made from the bridge during high water and by wading during ordinary stages.

Winter Flow.—Little backwater from ice at this station during the winter, except for short periods.

Diversions.—There are court decrees for diversions of 43 second-feet from East Elk Creek, chiefly above the station.

Accuracy.—Owing to the very meager gage heights, estimates have not been made other than for the days having gage heights.

Co-operation.—Records furnished by the United States Geological Survey.

EAST RIVER AT ALMONT.

Location.—At highway bridge at Almont, 100 feet above the junction of East and Taylor Rivers.

Records Available.—July 27, 1910, to November 30, 1913; March 7, 1916, to December 2, 1916. A station was maintained at this point from April 15 to October 8, 1905, but the gage was referred to a different datum.

Drainage Area.—295 square miles.

Gage.—Vertical staff.

Channel.—Shifting.

Discharge Measurements.—Made from bridge.

Winter Flow.—Ice causes backwater in varying amounts, but no measurements have been made to determine this.

Diversions.—There are court decrees for diversion of 78 second-feet from East River, above the station, and 52 second-feet from tributaries.

Accuracy.—Results for 1916 good.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of East Elk Creek at New Castle for 1918.
Drainage Area 60 Square Miles. Altitude, 5,552 Feet Above Sea Level.

TAYLOR RIVER AT ALMONT.

Location.—At highway bridge in Almont, in sec. 22, T. 51 N., R. 1 E., New Mexico principal meridian, 800 feet above the junction of Taylor and East Rivers.

Records Available.—July 27, 1910, to November 30, 1913; March 15, 1915, to December 2, 1916.

Drainage Area.—413 square miles.

Gage.—Vertical staff.

Channel.—Practically permanent.

Discharge Measurements.—Made from highway bridge.

Winter Flow.—Ice causes backwater.

Diversions.—There are no court decrees for diversions from Taylor River, but from Willow Creek, which enters above, there are decrees for 12 second-feet diversion.

Accuracy.—Conditions are favorable for accurate results; the estimates are considered good.

Co-operation.—Records furnished by the United States Geological Survey.

GUNNISON RIVER NEAR GUNNISON.

Location.—At highway bridge, 2 miles below Gunnison. Nearest tributary, Tomichi Creek, enters about 1 mile below.

Records Available.—November 27, 1910, to November 30, 1914; April 27, 1916, to August 14, 1916.

Drainage Area.—1,010 square miles.

Gage.—Bristol automatic gage.

Channel.—Somewhat shifting.

Discharge Measurements.—Made from bridge during high water and by wading at ordinary stages.

Winter Flow.—Ice causes backwater during the winter months.

Diversions.—There are court decrees for diversions of 250 second-feet from Gunnison River, between this station and the forks at Almont, and diversions of 270 second-feet from intervening tributaries.

Co-operation.—Station is maintained in co-operation with the United States Geological Survey.

Discharge of Taylor River at Almont for 1915.
Drainage Area, 413 Square Miles. Altitude, 8,031 Feet Above Sea Level.

Aug. 15 to Aug. 31, estimated 730 sec. ft.

Sept. estimated 535 sec. ft.

Unless otherwise noted, all discharges are in cubic feet per second.

UNCOMPAHGRE RIVER AT OURAY.

Location.—Near highway bridge in sec. 31, T. 44 N., R. 7 W., New Mexico principal meridian, half a mile south of Ouray, Colo. Nearest tributary, Canon Creek, enters 150 feet below; nearest tributary above is Bear Creek.

Records Available.—January 25, 1911, to December 31, 1916; January 7 to March 17, 1908, records were kept at the power plant of the Ouray Electric Light & Power Co., 1 mile south of Ouray.

Drainage Area.—44 square miles.

Gage.—Vertical staff.

Channel.—Permanent, except at time of high water, when channel scours and fills.

Discharge Measurements.—Made from bridge during high water and by wading at ordinary stages.

Winter Flow.—Little if any backwater from ice at this station, as channel remains open during the year.

Diversions.—Water is diverted 2 miles above the station by the Ouray Light & Power Co. This amounts approximately to 8 second-feet and is returned to the river below the station.

Accuracy.—Results considered reliable.

Co-operation.—Records furnished by the United States Geological Survey.

UNCOMPAHGRE RIVER BELOW OURAY.

Location.—At left bank 700 feet above the lowest bridge in Ouray, one-third mile below the railroad station. It is below all tributaries in Ouray.

Records Available.—May 12, 1913, to December 31, 1916.

Drainage Area.—76 square miles.

Gage.—Vertical staff, moved upstream from former location. No relation established between old and new gages.

Control.—Shifting.

Discharge Measurements.—Made from bridge and by wading.

Winter Flow.—Ice causes little or no backwater as the warm springs above prevent freezing.

Diversions.—There are no diversions which are not returned to the river above the station.

Accuracy.—Owing to the high altitude of the station (7,700 feet), there are diurnal fluctuations of stage at certain seasons, due to alternate melting and freezing, and the mean daily gage height, based on morning and evening readings and the maximum stage for the 24-hour period, may be somewhat in error. For this reason, and because of the shifting character of the channel, the estimates can not be considered better than fair, or, possibly, good.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of Uncompahgre River at Ouray for 1915.
Drainage Area, 44 Square Miles. Altitude, 7,710 Feet Above Sea Level.

UNCOMPAHGRE RIVER AT MONTROSE.

Location.—At highway bridge, one-fourth mile west of Montrose. Nearest important tributary, Happy Canyon Creek, enters about 2 miles below.

Records Available.—April 22, 1903, to December 16, 1913; March 8, 1915, to October 31, 1916.

Drainage Area.—565 square miles.

Gage.—Vertical staff; location and datum unchanged.

Channel.—Extremely shifting.

Discharge Measurements.—Made from the bridge.

Winter Flow.—Although ice forms along the edges of the river during the winter months, the river does not freeze over. Observations of gage heights are, however, discontinued during November, December, January, February, and March.

Diversions.—Uncompahgre River is so over-appropriated that the United States Reclamation Service is constructing a tunnel and canal to divert 1,300 second-feet from Gunnison River into the Uncompahgre above Uncompahgre.

Accuracy.—Although the channel is extremely shifting, sufficient discharge measurements were made to afford data for estimates by the indirect method, and these estimates may be considered reliable.

Co-operation.—Records furnished by the United States Geological Survey.

UNCOMPAHGRE RIVER NEAR DELTA.

Location.—At highway bridge on township line between Tps. 95 and 96, 2 miles south of Delta; no tributaries between the station and the mouth and no important tributaries for several miles upstream.

Records Available.—April 29, 1903, to December 18, 1913; March 8, 1915, to October 31, 1916.

Drainage Area.—1,130 square miles.

Gage.—Vertical staff.

Channel.—Extremely shifting.

Discharge Measurements.—Made from the bridge.

Winter Flow.—The flow is probably not materially affected by ice, although ice forms along the edges and slush ice frequently occurs. Observations are discontinued during the winter months.

Diversions.—The normal flow is diverted during the irrigation season by ditches above the station, so that the records represent largely return seepage water.

Accuracy.—Estimates only fair, or, for certain periods, possibly good, measurements being insufficient to permit use of indirect method for shifting channels to fullest extent.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of Uncompahgre River at Montrose for 1915.
Drainage Area, 565 Square Miles. Altitude, 5,820 Feet Above Sea Level.

CANON CREEK AT OURAY.

Location.—At Ouray, Colo., in sec. 31, T. 44 N., R. 7 W., New Mexico principal meridian, in the Uncompahgre Forest, 200 feet above the mouth of the creek. Nearest tributary, a small stream, enters from the east some distance above.

Records Available.—January 25, 1911, to November 30, 1915; discontinued November 30, 1915.

Drainage Area.—26 square miles.

Gage.—Vertical staff.

Channel.—Extremely shifting.

Discharge Measurements.—Made from near-by foot-bridge during high water and by wading at ordinary stages.

Winter Flow.—Ice causes practically no backwater at this station.

Diversions.—No water is diverted above the station, so the records represent the natural run-off.

Accuracy.—Results considered fair.

Co-operation.—Records furnished by the United States Geological Survey.

Discharge of Canon Creek at Ouray for 1915.
Drainage Area, 26 Square Miles. Altitude, 7,710 Feet Above Sea Level.

RIO GRANDE DRAINAGE

RIO GRANDE AT THIRTY-MILE BRIDGE, NEAR CREEDE, COLO.

Location.—In the Rio Grande National Forest, about 30 miles southwest of Creede, in sec. 13, T. 40 N., R. 4 W.; a short distance above mouth of Squaw Creek.

Records Available.—June 18, 1909, to November 30, 1916.

Drainage Area.—163 square miles.

Gage.—Staff gage.

Channel.—Section is gradually filling in.

Discharge Measurements.—Made from car and cable except during low stages, when they are made by wading.

Winter Flow.—Ice causes backwater during the winter months and records are discontinued.

Diversions.—So far as known, no water is diverted above the station.

Artificial Control.—A short distance above the station the San Luis Valley Irrigation District has constructed the large Rio Grande reservoir which materially modifies the flow of the river; also Lost Lake Reservoir.

Accuracy.—Results considered good.

Co-operation.—Station maintained in co-operation with San Luis Valley Irrigation District.

RIO GRANDE NEAR CREEDE.

Location.—In the Rio Grande National Forest, at a highway bridge in about sec. 8, T. 41 N., R. 1 E., a quarter of a mile from Wason siding and 3 miles southeast of Creede. Nearest tributary, Willow or Goblin Creek, enters a short distance upstream.

Records Available.—April 24, 1907, to November 30, 1916.

Drainage Area.—689 square miles.

Gage.—An automatic recording gage.

Channel.—Practically permanent.

Discharge Measurements.—Made from bridge.

Winter Flow.—River frozen over during winter months; ice causes backwater at gage.

Reservoirs.—Daily, monthly and annual discharges modified by storage in the Rio Grande and Santa Maria Reservoirs, 30 miles above.

Diversions.—There are no court decrees for diversions from the Rio Grande above this station, but for diversions of 39 second-feet from tributaries.

Accuracy.—Good.

Co-operation.—Maintained by the State engineer in co-operation with the United States Forest Service.

Discharge of Rio Grande at Thirty-Mile Bridge for 1915.
Drainage Area, 163 Square Miles. Altitude, 9,380 Feet Above Sea Level.

 Disc. estimated January 1st-March 27th.

RIO GRANDE NEAR DEL NORTE.

Location.—At highway bridge in about sec. 30, T. 40 N., R. 5 E., 6 miles west of Del Norte, a short distance below the mouth of Wolf Creek. From October 11, 1889, to November 30, 1906, a station was maintained about 4 miles below the present station and just above Los Pinos Creek. The flow at the two points is comparable, if a few small ditches are disregarded.

Records Available.—May 16, 1908, to November 30, 1916.

Drainage Area.—1,400 square miles.

Gage.—Automatic recording gage. The gage is referred to the same datum as was the chain gage installed May 16, 1908.

Channel.—Slightly shifting at sides from silt deposition at low water.

Discharge Measurements.—Made from bridge.

Winter Flow.—River is frozen over during the winter months.

Reservoirs.—Daily, monthly and annual discharges modified by storage in Beaver Park, Santa Maria and Rio Grande Reservoirs.

Diversions.—There are court decrees for diversions of 101 second-feet from the Rio Grande between the Creede station and Del Norte, and for diversions of 162 second-feet from intervening tributaries.

RIO GRANDE AT ALAMOSA.

Location.—At Concrete road bridge in Alamosa, one-third of a mile above D. & R. G. Railroad bridge, where station was originally established in 1894, discontinued in 1895, and re-established in 1912. The flow at the two points is comparable, except for one small ditch diversion. Records initiated by State of Colorado April 19, 1914.

Records Available.—Discharge measurements and gage heights September 24, 1894, to December 31, 1895. Miscellaneous measurements, 1903 and 1910. Daily discharges May 15, 1912, to November 30, 1916.

Drainage Area.—Not measured.

Gage.—An automatic recording gage.

Channel.—Shifting sand.

Discharge Measurements.—From Concrete road bridge at high water and by wading at low water.

Winter Flow.—Ice cover forms during winter months.

Diversions.—Below all but one of the large diversions from the Rio Grande.

Discharge of Rio Grande near Del Norte for 1915.
Drainage Area, 1,400 Square Miles. Altitude, 7,868 Feet Above Sea Level.

January 1st-February 24th, discharge estimated.

RIO GRANDE NEAR LOBATOS.

Location.—At highway bridge in sec. 22, T. 33 N., R. 11 E., 10 miles east of Lobatos and a few miles above the Colorado-New Mexico line; 17 miles below mouth of Conejos River.

Records Available.—June 28, 1899, to November 30, 1916.

Drainage Area.—7,700 square miles.

Gage.—Automatic recording gage. This gage is referred to the datum of the original gage.

Channel.—A gash cut in lava rock; shifting blanket of sand.

Discharge Measurements.—Made from bridge.

Winter Flow.—Ice causes backwater varying in amount during the three winter months.

Diversions.—There are court decrees for diversions from the Rio Grande of 5,134 second-feet between the Del Norte station and this one. There are also decrees for diversions from the following tributaries: Minor tributaries above Alamosa, 464 second-feet; Alamosa and tributaries, 2,116 second-feet; Conejos and tributaries, 3,464 second-feet; Culebra and tributaries, 177 second-feet.

SOUTH FORK OF RIO GRANDE AT SOUTH FORK.

Location.—At highway bridge half a mile west of South Fork station, in sec. 34, T. 40 N., R. 3 E. No tributaries between the station and the mouth and none for several miles above.

Records Available.—August 9, 1910, to November 9, 1916. Also a number of discharge measurements made in 1909 by the United States Geological Survey.

Drainage Area.—216 square miles.

Gage.—Chain gage established May 12, 1912, at the site of the original staff gage, but referred to a different datum. The original gage was washed out by flood October 5, 1911, and was replaced by an inclined staff gage at the railroad bridge at different datum, October 16, 1911. This gage was read until May 12, 1912.

Channel.—Apparently permanent at the present location.

Discharge Measurements.—Made from bridge.

Winter Flow.—Ice causes backwater during the winter months.

Reservoirs.—Daily and monthly discharges modified by storage in Beaver Park Reservoir.

Diversions.—There are court decrees for diversions of 11 second-feet from South Fork above the station; none below.

Discharge of Rio Grande near Lobatos for 1915.

Unless otherwise noted, all discharges are in cubic feet per second.
Discharge estimated, Jan. 1 to April 11.

SAGUACHE CREEK NEAR SAGUACHE.

Location.—At Ward's Ranch below the dam site of the Stark-Hagdorn Irrigation Co., 9 miles above Saguache. Ford Creek, the nearest important tributary, enters some distance below.

Records Available.—August 7, 1910, to September 30, 1912; June 1 to November 30, 1916.

Drainage Area.—595 square miles.

Gage.—An automatic recording gage.

Channel.—Shifting.

Discharge Measurements.—Made from footbridge during high water, and by wading at ordinary stages.

Winter Flow.—Ice causes backwater during the winter months.

Diversions.—There are court decrees for diversions of 46 second-feet from Saguache Creek above the station, and 365 second-feet below.

ALAMOSA RIVER ABOVE TERRACE RESERVOIR.

Location.—Four miles above Terrace Dam in sec. 8, T. 36 N., R. 6 E., of New Mexico meridian.

Records Available.—April 25, 1914, to November 12, 1916. For records of flow of Alamosa River prior to April 25, 1914, see station below reservoir.

Gage.—Vertical staff bolted to cribbing support for cable. Datum has remained unchanged. Bristol recording gage installed May 7, 1915. Referred to staff gage.

Channel.—Shifts during high water.

Discharge Measurements.—Made from cable and car at high stages and by wading at low stages.

Winter Flow.—Affected by ice and station discontinued during the winter months.

Diversions.—There are no decreed diversions above this station.

Accuracy.—Although the channel shifts somewhat, enough measurements have been obtained to make the estimates of discharge reliable.

Co-operation.—Station maintained in co-operation with the Terrace Irrigation District.

Discharge of Saguache Creek near Saguache for 1915.
Drainage Area, 595 Square Miles. Altitude, 7,800 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.
 Discharge estimated, April 1-2, May 7-10, inclusive.

ALAMOSA RIVER BELOW TERRACE RESERVOIR.

Location.—One-fourth mile below Terrace Dam in sec. 23, T. 36 N., R. 6 E., of New Mexico meridian.

Records Available.—April 18, 1909, to December 10, 1915; May 19, 1914, to November, 1916.

Gage.—Vertical staff gage bolted to left cliff at station. Gage location has been changed several times since station was established. Bristol gage installed May 7, 1915, referred to staff gage.

Channel.—Shifts during high water.

Discharge Measurements.—Made from cable at high stages and by wading at low stages.

Winter Flow.—Ice causes backwater effect and station is discontinued during the winter months.

Diversions.—There are no decreed diversions above this station.

Accuracy.—Although channel shifts somewhat, enough measurements have been made to make the estimates of discharge reliable.

Co-operation.—Station maintained in co-operation with the Terrace Irrigation District.

LA JARA CREEK NEAR CAPULIN.

Location.—In sec. 29, T. 34 N., R. 7 E., 13 miles above Capulin.

Records Available.—April 1 to October 31, 1916.

Drainage Area.—73 square miles.

Gage.—Bristol automatic.

Channel.—Fairly permanent.

Discharge Measurements.—By wading 25 to 40 feet below gage, except at extreme high water when measurements are made from highway bridge, $1\frac{1}{2}$ miles below. Two small ditches of not to exceed 6 cubic feet per second capacity divert water between gage and bridge.

Diversions.—Station is above all decreed ditches.

Regulation.—Flow is regulated to some extent by the La Jara reservoir.

Co-operation.—Station maintained in co-operation with the Terrace Irrigation District.

Discharge of Alamosa River at Weir, below Terrace Reservoir, for 1915.
Drainage Area, 120 Square Miles. Altitude, Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.
 Discharge estimated April 1-8, October 18-20.

CONEJOS RIVER NEAR MOGOTE.

Location.—At highway bridge near Mogote. From September 1, 1899, to March 31, 1900, and from April 17, 1903, to October 31, 1905, a station was maintained about 4 miles above Mogote. From March 21, 1907, to October 5, 1911, a station was maintained at Jacobs' Ranch, 8 miles above Mogote.

Records Available.—January 1, 1912, to November 30, 1916.

Drainage Area.—282 square miles.

Gage.—An automatic recording gage.

Channel.—Apparently permanent at present location.

Discharge Measurements.—Made from bridge.

Winter Flow.—Ice causes backwater during the winter months.

Diversions.—There are court decrees for diversion of 3,476 second-feet from Conejos River, all but 66 second-feet being diverted below the present station.

Reservoirs.—No reservoirs have been constructed on the Conejos above this station.

LOS PINOS CREEK NEAR ORTIZ, COLO.

Location.—At a small semi-circular flume supported by cables, 2½ miles above Ortiz, Colorado.

Records Available.—January 1, 1914, to October 31, 1916.

Drainage Area.—167 square miles.

Gage.—Bristol automatic.

Channel.—Slightly shifting.

Discharge Measurements.—Made by wading, except during high water, when they are made from flume.

Diversions.—One small ditch diverts water above the station.

Discharge of Conejos River near Mogote for 1915.
Drainage Area, 282 Square Miles. Altitude, 8,300 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

The following data were furnished by B. F. Tipton, Manager of the Baca Grant:

NORTH CRESTONE CREEK.

April 13 to September 18, meter station $\frac{1}{2}$ -mile below Crestone.

August 6 to September 6, 3-ft. rectangular weir at same point.

September 6 to end of season, 3-ft. rectangular weir used one mile above Crestone.

SOUTH CRESTONE CREEK.

June 26 to September 2, meter station $1\frac{1}{2}$ miles above Crestone Branch of D. & R. G. Railroad.

September 2 to November 10, weir station at same point.

WILLOW CREEK.

May 22 to August 28, meter station $1\frac{1}{2}$ miles above Crestone Branch of D. & R. G. Railroad.

August 28 to November 10, weir station at same point.

SPANISH CREEK.

June 18 to August 28, meter station $\frac{1}{2}$ mile below Crestone Branch of D. & R. G. Railroad.

August 28 to November 3, weir station at same point.

COTTONWOOD CREEK.

May 11 to July 28, meter station 1 mile below Crestone Branch of D. & R. G. Railroad.

July 28 to August 27, meter station 2 miles below railroad.

August 27 to 30, weir station 2 miles below railroad.

DEADMAN CREEK.

June 25 to September 8, meter station at mouth of canyon, 2 miles below east boundary of Baca Grant.

September 8 to November 3, weir station at same point.

Discharge of North Crestone Creek at Crestone for 1915.

SAN JUAN DRAINAGE

SAN JUAN RIVER AT ARBOLES.

Location.—At Arboles, Colo., a quarter of a mile above the mouth of Piedra River, near the center of T. 32 N., R. 5 W.

Records Available.—1895 to 1899; August 21, 1910, to November 30, 1914.

Drainage Area.—1,394 square miles.

Gage.—Chain gage.

Channel.—Probably permanent.

Discharge Measurements.—Made from car and cable and by wading.

Winter Flow.—Severe ice effect.

Diversions.—There are court decrees for the diversion of 23 second-feet between Arboles and the station at Pagosa Springs, and 61 second-feet from intervening tributaries.

Flood Discharge.—Two severe floods have occurred on the San Juan since the station has been maintained. The maximum stage of the flood, September 6, 1909, although very high, was less than that of October 1, 1911, when the river rose 17 feet, with a maximum discharge of about 40,000 second-feet.

Co-operation.—Station maintained by the State Engineer of New Mexico, by whom records were furnished.

NAVAJO RIVER AT EDITH.

Location.—Six miles northeast of Lumberton, N. Mex., at highway bridge on road from Lumberton to Edith, one-fourth mile east of Edith, short distance north of the New Mexico-Colorado State line, near southwestern corner of T. 33 N., R. 1 E., about 5 miles southwest and downstream from the confluence of Navajo and Little Navajo Rivers. A small tributary from the north enters Navajo River about one-fourth mile below the station.

Records Available.—September 21, 1912, to November 30, 1914.

Drainage Area.—Not measured.

Gage.—Verital staff.

Channel.—Permanent at low stages, but shifting during high.

Discharge Measurements.—At low stages made by wading; at high stages made from bridge.

Winter Flow.—Greatly affected by ice.

Diversions.—Considerable water is diverted above this station for irrigation.

Accuracy.—Estimates of daily discharge considered good.

Co-operation.—Station maintained by State Engineer of New Mexico, by whom the records were furnished.

Discharge of San Juan River at Arboles for 1915.
Drainage Area, 1,394 Square Miles. Altitude, 6,000 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.
 Note.—From Jan. 1 to March 26 and Nov. 11 to Dec. 31, gage heights affected by ice, and discharges for January, February, and December were estimated from current meter measurements and observers' notes.

PIEDRA RIVER AT ARBOLES.

Location.—At the railroad bridge at Arboles, Colo., in sec. 16, T. 32 N., R. 5 W., 1 mile above the junction with the San Juan River. No tributaries between station and mouth.

Records Available.—June 19, 1895, to September 30, 1899; August 21, 1910, to November 30, 1914.

Drainage Area.—650 square miles.

Gage.—Chain gage.

Channel.—Practically permanent except during high water.

Discharge Measurements.—Made from the bridge during high water and by wading at ordinary stages.

Diversions.—There are court decrees for diversions of 18 second-feet from Piedra River in Colorado and 52 second-feet from Colorado tributaries.

Co-operation.—Station maintained by the State Engineer of New Mexico.

LOS PINOS RIVER NEAR IGNACIO.

Location.—At the highway bridge near Ignacio Indian Agency, about sec. 8, T. 33 N., R. 7 W., New Mexico principal meridian, 1 mile north from Ignacio. Nearest tributary is a small stream that enters from the west 2 miles below.

Records Available.—April 22, 1899, to October 31, 1903; September 1, 1910, to November 30, 1914.

Drainage Area.—450 square miles.

Gage.—Chain gage.

Channel.—Shifting.

Discharge Measurements.—Made from the bridge during high water and by wading at ordinary stages.

Winter Flow.—No data.

Diversions.—A number of ditches divert water above the station for irrigation.

Co-operation.—Maintained by State Engineer of New Mexico, by whom the records were furnished.

Discharge of Piedra River at Arboles for 1915.
Drainage Area, 850 Square Miles. Altitude, 6,000 Feet Above Sea Level.

ANIMAS RIVER AT DURANGO.

Location.—Located opposite the San Juan Water & Power Co.'s sub-station, about one-fourth mile above Lightner Creek.

Records Available.—From June 20, 1901, to December 31, 1905; January 1, 1910, to December 31, 1910; January 1, 1912, to November 30, 1914, at a point above Lightner Creek; January 1, 1911, to December 31, 1911, below Lightner Creek.

Drainage Area.—694 square miles.

Gage.—Automatic recording gage.

Channel.—Liable to shift during high water.

Discharge Measurements.—Made from car and cable.

Winter Flow.—Little if any backwater from ice during the winter months.

Diversions.—Water is diverted above the station for irrigation.

Co-operation.—Station maintained by the State Engineer of New Mexico.

Discharge of Animas River at Durango for 1915.

Drainage Area, 694 Square Miles. Altitude, 6,550 Feet Above Sea Level.

NORTH AND SOUTH PLATTE DRAINAGES.

MIDDLE FORK SOUTH PLATTE RIVER AT ALMA.

Location.—At foot-bridge above the mouth of Buckskin Creek.

Records Available.—May 1, 1916, to August 15, 1916.

Gage.—Vertical staff fastened to foot-bridge.

Diversions.—Above all diversions on the stream.

Co-operation.—Station maintained by the Van Sant-Houghton Engineering Co., from whom the records were obtained.

MIDDLE FORK SOUTH PLATTE RIVER AT FAIRPLAY.

Location.—Located at highway bridge in town of Fairplay.

Records Available.—May 1, 1916, to October 31, 1916.

Drainage Area.—82.3 square miles.

Channel.—Rough, but probably permanent.

Gage.—Vertical staff gage.

Records furnished by the Van Sant-Houghton Engineering Co.

Discharge of Middle Fork South Platte River at Alma for 1916. Drainage Area, 23.7 Square Miles. Altitude, 10,285 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

NORTH FORK OF SOUTH PLATTE RIVER AT GRANT.

Location.—At Grant postoffice, in sec. 9, T. 7 S., R. 74 W., in the Pike National Forest, 250 feet above the mouth of Geneva Creek.

Records Available.—July 18, 1910, to November 9, 1916.

Drainage Area.—51 square miles.

Gage.—Vertical staff.

Channel.—Practically permanent.

Discharge Measurements.—Made from footbridge and by wading.

Winter Flow.—Ice causes backwater during the winter months and measurements are made to determine the flow.

Diversions.—There are court decrees for diversions 5.5 second-feet from the North Fork above the station, and there are decrees for diversions of 24 second-feet from the tributaries entering above.

Accuracy.—Though the channel is somewhat shifting, sufficient measurements were obtained to make estimates reliable.

Co-operation.—Station maintained in co-operation with the United States Geological Survey.

SOUTH FORK OF SOUTH PLATTE RIVER AT LAKE GEORGE.

Location.—At highway bridge in sec. 19, T. 12 S., R. 71 W., one-fourth mile below Lake George, in the Pike National Forest, about 2 miles above the mouth of Caylor Gulch; no tributary between the outlet of the lake and the station.

Records Available.—October 22, 1910, to November 13, 1916.

Drainage Area.—1,070 square miles.

Gage.—Automatic recording gage installed in 1911, reading to the same datum as the original staff gage.

Channel.—Conditions in the channel will remain unchanged as long as the control for the station—a 2-foot timber-crib dam 50 feet below the gage—remains permanent.

Discharge Measurements.—Made from bridge during high water and by wading at ordinary stages.

Winter Flow.—Ice causes backwater during the winter months and measurements are made to determine the flow.

Regulation.—The discharge at the station is regulated to some extent by the Antero Reservoir, located about 35 miles above, and by Lake George.

Diversions.—There are court decrees for diversions of 1,076 second-feet from South Fork above this station and for diversions of 1,816 second-feet from tributaries entering above.

Accuracy.—Results are considered fair.

Co-operation.—Station maintained in co-operation with United States Forest Service and the United States Geological Survey.

Discharge of North Fork South Platte River at Grant for 1915.
Drainage Area, 49 Square Miles. Altitude, 8,568 Feet Above Sea Level.

Acre-ft.			3790	3440	5820	9160	12300	13500	10400	13000	1180	

Unless otherwise noted, all discharges are in cubic feet per second.

NORTH FORK OF SOUTH PLATTE AT SOUTH PLATTE.

Location.—In sec. 25, T. 7 S., R. 70 W., one-third mile above South Platte. No tributary between station and mouth at South Platte.

Records Available.—January 4, 1909, to September 30, 1910; April 1, 1913, to November 8, 1916.

Drainage Area.—450 square miles.

Gage.—Inclined staff whose datum has remained unchanged.

Channel.—Somewhat shifting.

Discharge Measurements.—Made from car and cable during high and medium stages, and by wading at low stages.

Winter Flow.—Ice causes backwater and discharge measurements are made to determine the flow.

Diversions.—There are court decrees for diversions of 20 second-feet from North Fork between Grant and South Platte, and 62 second-feet from intervening tributaries, exclusive of Geneva Creek. There are also a number of small ice and fish ponds which divert small amounts of water at various times.

Accuracy.—Records considered good.

Co-operation.—Station maintained in co-operation with the United States Geological Survey.

SOUTH PLATTE RIVER AT SOUTH PLATTE.

Location.—In sec. 25, T. 7 S., R. 70 W., in the Pike National Forest, three-fourths of a mile east of South Platte; about 300 feet below junction of the North and South forks; no tributary between the forks and the station, and none for several miles below.

Records Available.—March 28, 1902, to November 7, 1916.

Drainage Area.—2,610 square miles.

Gage.—An automatic recording gage.

Channel.—Shifting.

Discharge Measurements.—Made from car and cable during high water, and by wading at low stages.

Winter Flow.—Ice causes backwater during a portion of the winter months and measurements are made to determine the flow.

Regulation.—The flow is regulated to a certain extent by the Cheesman Reservoir, which is on the South Fork about 20 miles above the forks.

Diversions.—Lake Cheesman has a storage decree for 80,000 acre-feet and the Antero Reservoir for 46,000 acre-feet on the South Fork, South Platte, besides numerous decrees for meadow irrigation.

Accuracy.—Although the channel is shifting, sufficient discharge measurements have been obtained to enable fair estimates of discharge to be made.

Co-operation.—Station maintained in co-operation with the United States Geological Survey.

Discharge of North Fork South Platte River at South Platte for 1915.
Drainage Area, 450 Square Miles. Altitude, 6,097 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

SOUTH PLATTE RIVER AT DENVER.

Location.—Between the 15th Street and 16th Street bridges in Denver, about 500 feet below the mouth of Cherry Creek.

Records Available.—May 7, 1895, to December 31, 1916.

Drainage Area.—3,840 square miles.

Gage.—Automatic and chain gages. The chain gage was replaced by a slope gage November 9, 1916.

Channel.—Shifting.

Discharge Measurements.—Made from 15th Street or 19th Street bridges, or by wading.

Winter Flow.—The flow at this point is seldom affected by ice.

Diversions.—There are decrees for diversions of 1,922 second-feet from the South Platte between this station and South Platte and 5,988 second-feet from tributaries.

SOUTH PLATTE RIVER NEAR KERSEY.

Location.—At highway bridge in sec. 9, T. 5 N., R. 64 W., $1\frac{3}{4}$ miles north of Kersey, 2 miles below the entrance of Lone Tree Creek, an intermittent stream and 3 miles below the mouth of the Cache la Poudre River.

Records Available.—April 27, 1901, to October 31, 1903; March 1, 1905, to November 30, 1912; January 1, 1914, to December 31, 1916.

Drainage Area.—9,500 square miles.

Gage.—A chain gage, placed in the fall of 1906 in each of the two channels in which the river flows. These gages were referred to a datum slightly different from that of the original gage. During the past two years either one or the other of these gages have been stolen at various times, and a breakwater placed to protect the bridge has caused one channel to become practically dry during low and medium stages. Results have, therefore, been based largely on one gage.

Channel.—Shifting.

Discharge Measurements.—Made from bridge at high water and by wading at low water.

Winter Flow.—Ice causes slight backwater for a few days during the winter.

Diversions.—Between this station and Denver there are court decrees for diversions of 3,764 second-feet from the South Platte, and 17,000 second-feet from intervening tributaries, besides numerous flood water decrees.

Accuracy.—The channel is extremely shifting and results cannot be considered better than fair.

Discharge of South Platte River at Denver for 1915.
Drainage Area, 3,240 Square Miles. Altitude, 5,240 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

SOUTH PLATTE RIVER NEAR JULESBURG.

Location.—At highway bridge one mile south of Julesburg, about sec. 33, T. 12 N., R. 44 W. No important tributaries between this station and the Colorado-Nebraska State line a few miles below. All the tributaries for 100 miles or more above the station are intermittent.

Records Available.—April 2, 1902, to November 16, 1906; May 12, 1908, to November 30, 1912; April 8, 1914, to November 30, 1916.

Drainage Area.—20,600 square miles.

Gage.—When the station was re-established in 1908 a gage was placed in each of the two main channels; both gages read practically the same as the original gage on the lower bridge 2,000 feet below the present site. On May 5, 1915, six scales with open pulleys were placed on the bridge. The zeros of these scales were arranged so as to be at the same datum. These scales are numbered one to six, beginning at the south end of the bridge. Gages numbered one, two and three are over one channel.

Channel.—Shifting.

Discharge Measurements.—Made from bridge at high water and wading at low water stages.

Winter Flow.—Ice causes backwater during the winter months.

Diversions.—Between Kersey and Julesburg there are court decrees for diversions of 5,316 second-feet from the South Platte, and diversions of 1,240 second-feet from intervening tributaries, including Lodgepole Creek in Wyoming and Nebraska and Crow Creek in Wyoming, besides numerous flood decrees. Between the state line and mouth, diversions of 206 second-feet from the South Platte have been granted in Nebraska.

Accuracy.—Sufficient measurements have been made so that results can be considered good.

Co-operation.—During 1915 this station was maintained in co-operation with the State Engineer of Nebraska. During 1916 the station was maintained by the State Engineer of Colorado. The salary of the gage reader is paid by the Great Western Sugar Company.

Note.—Results for 1915 are based on gage readings taken on scales numbered one, two and three. In 1916 each main channel has been computed separately and the totals for the entire stream published.

TARRYALL CREEK NEAR JEFFERSON.

Location.—At Robbins ranch, in sec. 6, T. 9 S., R. 74 W., about 10 miles southeast of Jefferson. Rock Creek enters half a mile below.

Records Available.—June 27, 1914, to November 11, 1916.

Drainage Area.—223 square miles.

Gage.—Vertical staff.

Channel.—Slightly shifting.

Discharge Measurements.—Made by wading and from footbridge 400 feet down stream.

Winter Flow.—Ice causes backwater during the winter months and the records are discontinued.

Diversions.—There are court decrees for diversions of 314 second-feet from Tarryall Creek above the station and for 926 second-feet from tributaries entering above. The Boreas Ditch diverts a small amount of water from the Blue River to Tarryall Creek.

Accuracy.—Results fair.

Co-operation.—Records furnished by the United States Geological Survey.

**Discharge of South Platte River near Julesburg for 1915.
Altitude, 3,469 Feet Above Sea Level.**

Unless otherwise noted, all discharges are in cubic feet per second.

GENEVA CREEK AT GRANT.

Location.—In the Pike National Forest, at highway bridge in sec. 9, T. 7 S., R. 74 W., at Grant postoffice; 300 feet above mouth of creek.

Records Available.—November 3, 1911, to November 8, 1916.

Drainage Area.—74 square miles.

Gage.—Vertical staff.

Channel.—Practically permanent.

Discharge Measurements.—Made from bridge during high water and by wading at ordinary stages.

Winter Flow.—Ice causes backwater during the winter months. Discharge estimated from measurements.

Diversions.—There is a court decree for a diversion above this station for 1.0 second-feet from Geneva Creek and a provisional decree for 480 acre-feet.

Accuracy.—Results are considered good.

Co-operation.—Station maintained in co-operation with the United States Geological Survey.

CLEAR CREEK NEAR GOLDEN.

Location.—About 2 miles above Golden, in sec. 6, T. 4 S., R. 70 W., and a short distance below the headgate of the Golden ditch. The only tributary of importance between the station and the mouth is Ralston Creek, which enters about 12 miles below.

Records Available.—December 4, 1908, to December 31, 1909; June 8 to September 24, 1911; January 26, 1912, to November 7, 1916.

Drainage Area.—Approximately 380 square miles.

Gage.—Automatic recording gage, whose datum has remained unchanged.

Channel.—Slightly shifting.

Discharge Measurements.—Made from car and cable located near the gage.

Winter Flow.—Ice causes backwater during the winter months, but discharge measurements are made to determine the approximate winter flow.

Diversions.—Between Forks Creek and the station near Golden there is a court decree for a diversion of 26 second-feet by the Golden ditch.

Accuracy.—Conditions are favorable for accurate results, and the records should be reliable.

Co-operation.—Records were furnished by the United States Geological Survey.

Discharge of Geneva Creek at Grant for 1915.
Drainage Area, 74 Square Miles. Altitude, 8,566 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

SOUTH BOULDER CREEK NEAR ROLLINSVILLE.

Location.—At highway bridge in sec. 35, T. 1 S., R. 73 W., 1 mile west of Rollinsville, in the Pike National Forest. The nearest important tributary, Jennie Creek, enters 4 miles above.

Records Available.—September 10, 1910, to December 31, 1916.

Drainage Area.—39 square miles.

Gage.—Vertical staff.

Channel.—Fairly permanent.

Discharge Measurements.—Made from bridge during high water and by wading at ordinary stages.

Winter Flow.—Ice causes backwater during the winter months. Flow estimated from measurements.

Diversions.—There are no court decrees for diversions above the station, and therefore it is probable that the records represent the natural run-off.

Accuracy.—Conditions are favorable for fairly accurate results and the estimates of discharge should be reliable.

Co-operation.—Records furnished by the United States Geological Survey.

SOUTH BOULDER CREEK AT ELDORADO SPRINGS.

Location.—At the mouth of the canyon at Eldorado Springs, in sec. 30, T. 1 S., R. 70 W., 3 miles southwest of Marshall. No important tributaries within several miles.

Records Available.—May 15, 1895, to September 30, 1901; July 1, 1904, to November 30, 1916.

Drainage Area.—125 square miles.

Gage.—Vertical staff; datum unchanged.

Channel.—Fairly permanent.

Discharge Measurements.—Made by wading.

Winter Flow.—Warm springs keeping channel open during the winter.

Diversions.—There are court decrees for diversions of 137 second-feet above the station and 1,658 second-feet below. There are also a number of flood-water decrees.

Discharge of South Boulder Creek near Hollinsville for 1915.
Drainage Area, 39 Square Miles. Altitude, 8,500 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.
 Note.—Discharge of Community Canal included.

BOULDER CREEK AT ORODELL.

Location.—At Orodell Station in sec. 27, T. 1 N., R. 71 W., just above the mouth of Four-Mile Creek.

Records Available.—March 18, 1907, to November 26, 1914; February 27 to December 12, 1916. From May 14, 1895, to December 20, 1909, a station was maintained about 1 mile below the present site, chiefly by the State Engineer. The records at the two points are not directly comparable, as some water is diverted for irrigation between.

Drainage Area.—108 square miles.

Gage.—Automatic recording gage installed by the Colorado Power Company.

Channel.—Shifts in extreme high water.

Discharge Measurements.—Made from car and cable.

Winter Flow.—Ice causes backwater during the winter months and during that period discharge measurements are made to determine the flow.

Diversions.—There are no diversions from Boulder Creek above the station, but there are court decrees for diversions of 165 second-feet from tributaries entering above. Below the station there are decrees for diversions of 2,871 second-feet from Boulder Creek.

Co-operation.—Station maintained in co-operation with the Colorado Power Co.

ST. VRAIN CREEK AT LYONS.

Location.—Three-fourths of a mile below Lyons, in sec. 17, T. 3 N., R. 70 W., one-fourth mile below the junction of North and South St. Vrain Creeks and just below Stone Canyon.

Records Available.—August 1, 1887, to October 31, 1890; June 13, 1895, to October 31, 1903; July 1, 1904, to December 31, 1916.

Drainage Area.—209 square miles.

Gage.—Inclined staff gage installed August 9, 1909, at practically the same datum as the inclined staff gage used from 1895 to 1903. It is not known whether the gage used prior to 1895 was located at the present site.

Channel.—Permanent.

Discharge Measurements.—Made from car and cable.

Winter Flow.—Ice causes very little backwater at this station.

Diversions.—There are court decrees for the diversion of 166 second-feet from the St. Vrain and tributaries above the station. Below there are court decrees for 1632 second-feet from St. Vrain Creek and flood-water diversions of 190,000 acre-feet.

Co-operation.—Station maintained in co-operation with the Great Western Sugar Co.

Discharge of Boulder Creek at Orodell for 1916.
Drainage Area, 108 Square Miles. Altitude, 5,723 Feet Above Sea Level.

CACHE LA POUDRE RIVER AT MOUTH OF CANON, NEAR FORT COLLINS.

Location.—In sec. 15, T. 8 N., R. 70 W., three miles below the intake of the Fort Collins waterworks, 12 miles above Fort Collins; half a mile above mouth of Lewstone Creek.

Records Available.—March 15, 1884, to October 15, 1901; February 3, 1910, to November 14, 1916.

Drainage Area.—1,060 square miles.

Gage.—An automatic recording gage installed November 30, 1909. No information available concerning the gage used 1884 to 1901.

Channel.—Permanent.

Discharge Measurements.—Made from car and cable.

Winter Flow.—Ice causes backwater during the winter months.

Regulation.—The flow is regulated by the Chambers Lake and Haligan Reservoirs and by ditches diverting water from the headwaters of the Laramie and Grand Rivers and Michigan Creek across the divide.

Diversions.—There are court decrees for the diversion of 614 second-feet above this station.

CACHE LA POUDRE RIVER AT MOUTH.

Location.—About three miles below Greeley and one-half mile above mouth.

Records Available.—March 24, 1903, to October 31, 1903; July 20, 1904, to November 30, 1904; February 1, 1914, to December 11, 1916.

Gage.—The vertical staff gage used since 1914 was replaced April 4, 1916, by a slope gage on the right bank directly opposite the old gage, but reading 2.50 feet lower. A Bristol automatic gage was also installed on this date.

Discharge Measurements.—By wading at low stages and from highway bridge about one mile above at high stages.

Diversions.—Below all diversions on this stream.

Accuracy.—Low water measurements are good, but high water measurements are subject to error on account of poor conditions at the highway bridge.

Co-operation.—During 1916, station was maintained in co-operation with the Colorado Experiment Station.

Discharge of Cache la Poudre River at Mouth of Canon for 1915.
Drainage Area, 1,000 Square Miles. Altitude, 5,070 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

NORTH PLATTE RIVER NEAR NORTH GATE, COLO.

Location.—In sec. 11, T. 11 N., R. 80 W., at highway bridge on Interstate Highway, 6 miles south of Colorado-Wyoming line and 6 miles northwest of North Gate, in Jackson County. Three small tributaries, Camp, Three-Mile, and Six-Mile Creeks, enter North Platte between station and state line. These have very little flow except spring run-off.

Drainage Area.—1,440 square miles.

Records Available.—May 23, 1915, to November 8, 1916.

Gage.—Vertical staff located at downstream side of center pier.

Discharge Measurements.—Made from two-span bridge during high water, and by wading at low stages.

Channel and Control.—Channel composed of sand, gravel, and small boulders; control located 200 feet downstream at small rapids which shift slightly. Banks not liable to overflow.

Ice.—Discharge relation seriously affected by ice; observations discontinued during winter months.

Diversions.—There are court decrees for diversions of 3,060 second-feet from the North Platte and tributaries in Colorado.

Regulation.—None.

Accuracy.—Results excellent.

Co-operation.—Station maintained by the United States Geological Survey, from whom records were obtained.

LARAMIE RIVER AT GLENDEVEY.

Location.—At highway bridge one-eighth mile west of Glendevoy in sec. 36, T. 10 N., R. 76 W., in the Medicine Bow National Forest; McIntyre Creek enters a short distance below and Nunn Creek above.

Records Available.—June 24, 1904, to October 31, 1905; August 18, 1910, to October 17, 1916.

Drainage Area.—102 square miles.

Gage.—Automatic gage installed by the State Engineer November 17, 1910, replaced vertical staff previously used. The datum of the gages has remained constant.

Channel.—Permanent.

Discharge Measurements.—Made from bridge during high water and by wading at ordinary stages.

Winter Flow.—Ice causes backwater during the winter months.

Diversions.—There are court decrees for diversions of 65 second-feet from Laramie River above the station and for 749 second-feet from tributaries entering above. Of this latter amount 688 second-feet are for diversion into the Cache la Poudre basin.

Accuracy.—Conditions are favorable for excellent results, and the estimates should be reliable.

Discharge of North Platte River near North Gate for 1915.
Drainage Area, 1,440 Square Miles. Altitude, 7,000 Feet Above Sea Level.

LARAMIE RIVER NEAR JELM, WYO.

Location.—At highway bridge in sec. 15, T. 12 N., R. 77 W., 4 miles south of Jelm postoffice, one-fourth mile below the Colorado-Wyoming line.

Records Available.—May 7, 1911, to November 19, 1916. From June 22, 1904, to October 31, 1905, a station was maintained at Decker's ranch, half a mile south of the state line. The records at the two stations are practically comparable as there are no tributaries nor diversions of any amount between.

Drainage Area.—293 square miles.

Gage.—In 1911 an automatic recording gage was installed. This is referred to the same datum as the vertical staff used at first.

Channel.—Practically permanent.

Discharge Measurements.—Made from bridge.

Winter Flow.—Ice causes backwater during the winter months and the records are discontinued.

Diversions.—Between this station and that at Glendevay, Colo., there are court decrees for diversions of 236 second-feet from Laramie River and 204 second-feet from intervening tributaries. These diversions are all in Colorado.

Accuracy.—Conditions are favorable for accurate results, and the estimates should be excellent.

Discharge of Laramie River at Boswell's Ranch near Jelm, Wyo., for 1915.
Drainage Area, 293 Square Miles. Altitude, Feet Above Sea Level.

YAMPA AND WHITE DRAINAGES

YAMPA RIVER AT YAMPA.

Location.—On the bridge connecting the town of Yampa with the Denver and Salt Lake Railroad station.

Records Available.—May 17, 1910, to December 6, 1915.

Drainage Area.—52 square miles.

Gage.—Chain gage.

Channel.—Shifting during high water.

Discharge Measurements.—Made from the highway bridge.

Winter Flow.—Ice causes backwater and the records are discontinued during the winter months.

Diversions.—There are court decrees for diversions of 258 second-feet from the headwater streams above Yampa.

YAMPA RIVER AT STEAMBOAT SPRINGS.

Location.—This station was moved from the lower steel bridge to the Fifth Street bridge at Steamboat Springs on April 26, 1915. It is about one-quarter mile below Spring Creek and one-half mile above Soda Creek.

Records Available.—May 3, 1904, to October 31, 1906; March 1, 1910, to November 30, 1916.

Drainage Area.—500 square miles.

Gage.—Automatic recording gage and vertical staff gage.

Channel.—Practically permanent.

Discharge Measurements.—Made from highway bridge.

Winter Flow.—Hot springs above keep the river practically open during the winter months.

Diversions.—There are court decrees for diversions of 115 second-feet from the Yampa River between Yampa and Steamboat Springs, and diversions of 231 second-feet from intervening tributaries. There are decrees for 258 second-feet above Yampa.

YAMPA RIVER AT CRAIG.

Location.—One mile south of Craig on steel bridge on road to Hamilton, Colo., a short distance below the mouth of Fortification Creek, the nearest tributary.

Records Available.—May 25, 1901, to September 4, 1902; April 30, 1904, to October 31, 1906; April 1, 1910, to November 13, 1916.

Drainage Area.—1,730 square miles.

Gage.—Chain gage.

Channel.—Slightly shifting.

Discharge Measurements.—Made from highway bridge.

Diversions.—There are court decrees for diversions of 238 second-feet from Yampa River between this station and Steamboat Springs, and 411 second-feet from intervening tributaries exclusive of a conditional decree for 587 second-feet from the North Fork of Elkhead Creek.

Discharge of Yampa River at Yampa for 1915.
Drainage Area, 52 Square Miles. Altitude, 7,894 Feet Above Sea Level.

YAMPA RIVER NEAR MAYBELL.

Location.—At highway bridge about three miles above Maybell in sec. 2, T. 6 N., R. 95 W. Nearest tributary, Deception Creek, enters about one mile below.

Records Available.—April 24 to November 12, 1916. From April 17, 1904, to October 31, 1905, and from June 12, 1910, to November 30, 1912, a station was maintained at the Thornburg bridge, about nine miles below Maybell. The present station was established April 25, 1916.

Gage.—Chain gage located on highway bridge.

Channel.—Probably permanent.

Winter Flow.—Station discontinued during the winter months.

Diversions.—Between this station and Craig there are decrees for diversions of 131 second-feet from the Yampa River and 3,269 second-feet from intervening tributaries.

Co-operation.—Station maintained in co-operation with the United States Geological Survey.

SODA CREEK AT STEAMBOAT SPRINGS.

Location.—At the Main Street Bridge at Steamboat Springs, below all tributaries, the nearest being a small creek that enters from the east about 2 miles above.

Records Available.—June 8, 1910, to August 31, 1911; April 24, 1913, to November 30, 1916.

Drainage Area.—47 square miles.

Gage.—Chain gage.

Channel.—Practically permanent.

Discharge Measurements.—Made from highway bridge.

ELK RIVER AT HINMAN PARK.

Location.—At Hinman Park just above the mouth of South Fork and 8 miles above Clark.

Records Available.—May 25, 1912, to November 30, 1916.

Drainage Area.—61 square miles.

Gage.—Bristol automatic gage.

Channel.—Rough, but permanent.

Discharge Measurements.—Made from cable and car.

Winter Flow.—Ice causes backwater. Station discontinued during the winter months.

Co-operation.—Station is maintained by the State Engineer in co-operation with the Elk River Irrigation & Construction Co.

Discharge of Yampa River at Maybell for 1916.

Unless otherwise noted, all discharges are in cubic feet per second.

ELK RIVER NEAR CLARK.

Location.—At Kinney's ranch, 2 miles above Clark postoffice.

Records Available.—May 1, 1910, to September 30, 1916.

Drainage Area.—206 square miles.

Gage.—Chain gage.

Channel.—Rough but permanent.

Diversions.—There are court decrees for diversions of 4 second-feet from Elk River above this station and 25 second-feet from the tributaries entering above.

Co-operation.—The State Engineer maintains the station in co-operation with the Elk River Irrigation & Construction Co.

ELK RIVER NEAR TRULL.

Location.—Two miles southwest of Trull postoffice on the road between Steamboat Springs and Hayden; below all tributaries; none above the station for several miles.

Records Available.—May 2, 1904, to August 16, 1906; May 1, 1910, to November 30, 1916.

Drainage Area.—415 square miles.

Gage.—Chain gage.

Channel.—Fairly permanent.

Discharge Measurements.—Made from highway bridge.

Diversions.—Between this station and that near Clark there are court decrees for diversions of 111 second-feet from Elk River and 62 second-feet from intervening tributaries. There are no decrees for diversions below the station.

MAD CREEK NEAR STEAMBOAT SPRINGS.

Location.—At highway bridge on road to Hahn's Peak, 6 miles Steamboat Springs.

Records Available.—July 1, 1912, to November 30, 1916.

Drainage Area.—40 square miles.

Gage.—Vertical staff.

Channel.—Rough, but permanent.

Discharge Measurements.—Made from bridge.

Winter Flow.—No data, as records were discontinued.

Discharge of Elk River near Clark for 1915.

Unless otherwise noted, all discharges are in cubic feet per second.
 Note—Gage heights unreliable prior to July 1.

ELK HEAD CREEK NEAR CRAIG.

Location.—One mile above the mouth at bridge on road between Steamboat Springs and Craig, the latter being 6 miles west. No tributary between the station and the mouth and none for several miles above.

Records Available.—April 27 to September 7, 1906; April 17, 1910, to October 31, 1916.

Drainage Area.—249 square miles.

Gage.—Chain gage.

Channel.—Practically permanent.

Diversions.—There are court decrees for diversions of 45 second-feet from Elk Head Creek above the station and 48 second-feet from tributaries entering above. In addition, there are conditional decrees for reservoir diversions of 177,000 acre-feet from Elk Head Creek and a diversion of 587 second-feet from the North Fork.

FORTIFICATION CREEK AT CRAIG.

Location.—One-eighth mile east of Craig on the road to Hayden. No tributaries between the station and the mouth, and none for some distance above.

Records Available.—June 12, 1905, to July 30, 1906; March 5, 1910, to November 30, 1916.

Drainage Area.—256 square miles.

Gage.—Chain gage.

Channel.—Very shifting.

Discharge Measurements.—Made from bridge.

Diversions.—There are court decrees for diversions of 91 second-feet from Fortification Creek above the station and 20 second-feet from tributaries entering above. There is also a conditional decree for a diversion of 235,000 acre-feet from Fortification Creek.

WILLIAMS RIVER AT HAMILTON.

Location.—Near Hamilton, at highway bridge, on the road from Meeker to Craig. Morapos Creek, the nearest tributary, enters some distance below the station.

Records Available.—April 29, 1904, to October 31, 1906; April 15, 1910, to November 15, 1916.

Drainage Area.—341 square miles.

Gage.—Chain gage.

Channel.—Shifting.

Discharge Measurements.—Made from highway bridge.

Diversions.—There are court decrees for diversions of 40 second-feet from Williams River above the station, and 7 second-feet below. There are also decrees for diversions of 87 second-feet from tributaries entering above.

Discharge of Elk Head Creek near Craig for 1915.
Drainage Area, 249 Square Miles. Altitude, 6,200 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

SOUTH FORK OF LITTLE SNAKE RIVER AT GARDNER'S RANCH.

Location.—At Gardner's ranch, in sec. 28, T. 12 N., R. 86 W., 10 miles above Battle Creek. No important tributary between the station and the mouth.

Records Available.—May 8 to October 31, 1916.

Drainage Area.—46 square miles.

Gage.—Bristol automatic gage.

Channel.—Practically permanent.

Discharge Measurements.—From bridge.

Diversions.—There are decrees for diversions of 8 second-feet from the South Fork.

Co-operation.—The State Engineer maintains the station in co-operation with the Elk River Irrigation & Construction Co.

MIDDLE FORK OF LITTLE SNAKE RIVER AT GARDNER'S RANCH.

Location.—At Gardner's ranch, in sec. 21, T. 12 N., R. 86 W., on the county road bridge, 10 miles above Battle Creek.

Records Available.—May 8 to October 31, 1916.

Drainage Area.—152 square miles.

Gage.—Bristol automatic gage.

Channel.—Practically permanent.

Discharge Measurements.—From bridge.

Co-operation.—The State Engineer maintains the station in co-operation with the Elk River Irrigation & Construction Co.

SLATER FORK OF LITTLE SNAKE RIVER, AT BAXTER'S RANCH, NEAR SLATER.

Location.—At Baxter's ranch, in sec. 22, T. 11 N., R. 89 W., 10 miles south of Slater.

Records Available.—May 6, 1912, to November 15, 1916.

Drainage Area.—80 square miles.

Gage.—Bristol automatic gage. Staff gage after July 8, 1916.

Channel.—Rough but permanent.

Discharge Measurements.—From bridge.

Diversions.—There are court decrees for diversions of 14 second-feet from Slater Creek, all below the station.

Co-operation.—The State Engineer maintains the station in co-operation with the Elk River Irrigation & Construction Co.

Discharge of South Fork Little Snake River at Gardner's Ranch for 1915.
Drainage Area, 46 Square Miles. Altitude, 7,000 Feet Above Sea Level.

LITTLE SNAKE RIVER NEAR DIXON, WYO.

Location.—One mile west of Dixon, Wyo., in sec. 6, T. 12 N., R. 90 W. Nearest tributaries are Cottonwood Creek, which enters a short distance east of Dixon, and Willow Creek, which enters a mile or less downstream.

Records Available.—May 27, 1910, to November 30, 1916.

Drainage Area.—1,294 square miles.

Gage.—Chain gage.

Channel.—Slightly shifting during high water.

SAVERY CREEK NEAR SAVERY, WYO.

Location.—At bridge on road about one-half mile southeast of Savery, Wyo., and about one and one-half miles above mouth.

Records Available.—May 1, 1915, to November 17, 1916.

Drainage Area.—Not measured.

Gage.—Vertical staff.

Channel.—Practically permanent.

Discharge Measurements.—Made from bridge at high water and by wading at low stages.

Winter Flow.—Records discontinued during the winter months.

Accuracy.—Records considered good.

MUDDY CREEK NEAR BAGGS, WYO.

Location.—At road bridge, $1\frac{1}{4}$ miles northeast of Baggs, Wyo., and about 1 mile above mouth.

Records Available.—May 1, 1915, to August 10, 1916.

Drainage Area.—Not measured.

Gage.—Chain gage.

Channel.—Shifting.

Discharge Measurements.—Made from bridge and by wading.

Winter Flow.—Records discontinued during the winter months.

Accuracy.—Results fair.

Discharge of Little Snake River at Dixon, Wyoming, for 1915.
Drainage Area, 1,294 Square Miles. Altitude, 6,300 Feet Above Sea Level.

WILLOW CREEK AT RYAN'S RANCH, NEAR BAGGS, WYO.

Location.—In Colorado, about sec. 26, T. 11 N., R. 90 W., 2 miles northeast of Ryan's ranch house and 22 miles southeast of Baggs, Wyo. No important tributary between the station and the mouth of Willow Creek.

Records Available.—May 4, 1912, to November 30, 1916.

Drainage Area.—Approximately 5 square miles.

Gage.—Bristol automatic gage.

Channel.—Small cobblestones, placed especially for the station.

Discharge Measurements.—Made from foot-bridge.

Co-operation.—Station maintained by the State Engineer in co-operation with the Elk River Irrigation & Construction Co.

FOURMILE CREEK AT RANGER STATION, NEAR BAGGS, WYO.

Location.—In Colorado, at forest ranger station near Ryan's ranch, in sec. 9, T. 10 N., R. 90 W., 20 miles southeast of Baggs, Wyo.

Records Available.—May 1, 1912, to November 30, 1916.

Drainage Area.—Approximately 4 square miles.

Gage.—Bristol automatic gage.

Channel.—Probably permanent.

Discharge Measurements.—Made from foot-bridge.

Co-operation.—The State Engineer maintains the station in co-operation with the Elk River Irrigation & Construction Co.

Discharge of Willow Creek at Ryan's Ranch for 1915.
Drainage Area, 5.0 (Approx.) Square Miles. Altitude 8,000 Feet Above Sea Level.

NORTH FORK OF WHITE RIVER AT BUFORD.

Location.—At Genier's ranch, $1\frac{1}{2}$ miles above Buford, about sec. 3, T. 1 S., R. 91 W. No important tributary between the station and the mouth of South Fork. The gage and foot-bridge at Genier's ranch went out on May 27th, and was re-established on June 26th on the private road bridge at Buford P. O., $1\frac{1}{2}$ miles below.

Records Available.—May 24, 1910, to December 7, 1915.

Drainage Area.—240 square miles.

Gage.—Vertical staff.

Channel.—Practically permanent.

Discharge Measurements.—Made from private road bridge.

Diversions.—There is a court decree for a diversion of 1.6 second-foot from the North Fork above the station, but none below. There are also decrees for diversions of 33 second-foot from tributaries entering above the station.

SOUTH FORK OF WHITE RIVER NEAR BUFORD.

Location.—At Shepherd's ranch, 7 miles above Buford, about sec. 7, T. 2 S., R. 90 W. Nearest tributary a small creek that enters from the east just below the station.

Records Available.—July 25, 1903, to October 31, 1906, station maintained by the United States Geological Survey; June 1, 1910, to November 30, 1915.

Drainage Area.—148 square miles.

Gage.—Vertical staff.

Channel.—Fairly permanent.

Discharge Measurements.—Made from highway bridge during high water and by wading at ordinary stages.

Winter Flow.—Ice causes backwater and records are discontinued during the winter months.

Diversions.—There are no court decrees for diversions from the South Fork above the station, but below there is a decree for 5.4 second-feet. There is a decree for a diversion of 9.2 second-feet from tributaries entering above the station.

Discharge of North Fork White River at Buford for 1915.
Drainage Area, 240 Square Miles. Altitude, 7,000 Feet Above Sea Level.

Unless otherwise noted, all discharges are in cubic feet per second.

WHITE RIVER NEAR MEEKER.

Location.—At the Rees ranch, $3\frac{1}{2}$ miles east of Meeker, in sec. 24, T. 1 N., R. 93 W. Nearest tributary above is Curtis Creek; nearest below is Sulphur Creek. Station moved from Van Cleave's to Rees' ranch October 20, 1913.

Records Available.—May 7, 1910, to November 30, 1916. From April 12, 1904, to October 31, 1906, a station was maintained 2.5 miles below this point by the United States Geological Survey.

Drainage Area.—634 square miles.

Gage.—Automatic recording gage.

Channel.—Practically permanent.

Discharge Measurements.—Made from private road bridge.

Diversions.—There are court decrees for diversions of 186 second-feet from White River above the station and 59 second-feet from tributaries entering above. Below there are decrees for diversions of 198 second-feet from White River.

Note.—Station moved to get above the head of the Meeker Power Canal. Diversion started during winter of 1912-1913.

1913 records prior to October 20 corrected for the diversion. Average diversion about 90 second-feet.

Discharge of White River near Meeker for 1915.
Drainage Area, 634 Square Miles. Altitude, 6,182 Feet Above Sea Level.
